APPENDIX 115

P R E F A C E

The "АПК-5В Autopilot Operating Instructions" are intended for the plants, manufacturing "КС" winged missiles, and mechanical personnel of the using organizations.

The "АПК-5В Autopilot Operating Instructions" are the manual for storage, shipment, installation, checks and maintenance of the АПК-5В autopilot within the guaranteed service life.

The main form of storing the АПК-5В autopilot is keeping it in the "КС" winged missile being preserved in accordance with the present instructions КС-05-ЖТ, edition ЗЛ for preservation and extended storage of the "КС" missile in the depots for one year since the date of arrival to the point of destination.

The complete autopilot equipment may be installed in the "КС" missile or the И-2 gyro unit may be removed from it; in this case this unit is stored in a special metal tare.

The АПК-5В autopilot is permitted to be stored in the "КС" missile in a hangar for 3 months within the entire guaranteed service life.

The АПК-5В autopilot and its individual units which are not installed in the "КС" missile can be stored in the depots packed in special metal tare for one year since the date of arrival to the point of destination.

The АПК-5В autopilot and its individual units can be transported in tare or installed in the "КС" missile.

The requirements for the AHK-5B autopilot shipment are outlined in these instructions. The autopilot installed in the "KC" missile is shipped in accordance with the "KC" Winged Missile Maintenance and Operating Instructions", Book I.

The autopilot must be installed in and removed from the "KC" missile according to the "KC" Winged Missile Maintenance and Operating Instructions" Book I.

The amount and methods of the AHK-5B autopilot checkouts at the "KC" missile manufacturing plant, during an extended storage and also during the pre-flight test and test before a take-off are given in these Instructions.

S E C T I O N I

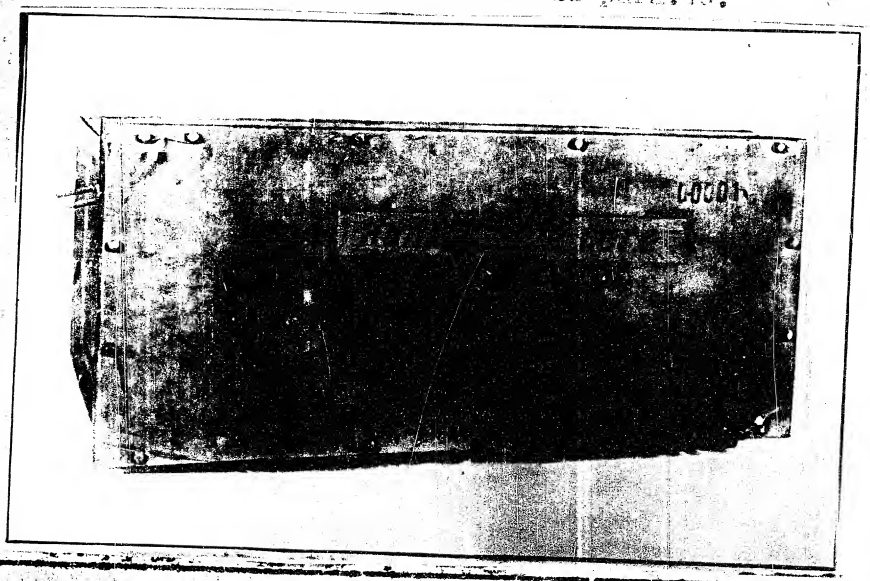
PACKING AND SHIPMENT OF THE АИК-5Б AUTOPILOT

I. INSTRUCTIONS FOR PACKING THE АИК-5Б AUTOPILOT UNITS IN RACK

1. The tare for the АИК-5Б autopilot consists of 2 welded metals cases. Packed in one of the cases are П-1 and П-2 units and in the other - П-4 and П-18М0 units and ПАГ-1ФА inverters. The cases are made according to drawings No.399.00.00.000 (for П-1 and П-2 units) and No.400.00.00.000 (for П-4, П-18М0 units and ПАГ-1ФА inverters).

The external view of one of the cases is given in Fig.1. Furnished with the metal case made according to dwg.No.399.00.00.000 is the box (dwg.399.01.00.000) with the plug connectors.

2. The rooms in which the АИК-5Б autopilots are packed should meet the requirements indicated in para.10.



3. Pack the П-1 control panel and П-2 gyro unit in cases as follows:

Install the П-1 control panel on the shock mounts (2) of the mounting (1, Fig.2) and secure it by 4 screws with nuts. Wrap the cables plug connectors with two sheets of oil paper (GOST 1760-53) and herringbone tape and bind the tape with linen threads.

Insert the plug connectors in the holders (3). Secure the cables by the tape with the button (4). Fasten the control panel filter in the clamp (6).

Install the П-2 gyro unit on the shock mounts (2) of the mounting (1, Fig.3) and secure by 3 bolts. Attach the П-2 gyro unit plug connectors No.31, 39, 42 (manufactured specially for the П-2 gyro units) 43, 45 and 47 to the flanges (3) using their coupling nuts. Fasten plug connector No.35 to the flange (4) by a coupling nut.

Cover the bent portions of cables No.39, 42 and 43 with a split chlorvinyl tubes (7, dia. 34) and secure them by the tape with the button (8) to the mounting.

Secure cables No.31, 35 and 44 by the tape with the button (9), cover them with the split chlorvinyl tube (10) and fasten them to plug connector No.35 by the tape with the button (11). Cover cables No.45 and 47 with the split chlorvinyl tube (12) and fasten them to plug connector No.45 by the tape with the button (13, Fig.3).

Secure the П-2 gyro unit filter to the mounting with the П-1 control panel by means of a clamp and plug connector No.44 by means of its coupling nut - to the flange located on the same mounting.

Move the mountings with the K-1 and K-2 units installed along the guide rails into the case placed on the floor; see that the mountings are in the vertical position. The mountings must move along the rails without shaking and sticking. If necessary, bend the guide rails.

Secure cables No.45 and 47 to cable No.44 by the tape with the button (1) and place them in the box (2, Fig.4) manufactured according to dwg. No.392.01.00.000, with the plug connector mating parts furnished with the autopilot set.

NOTE: The chlorvinyl tubes may be substituted by chlorvinyl tape.

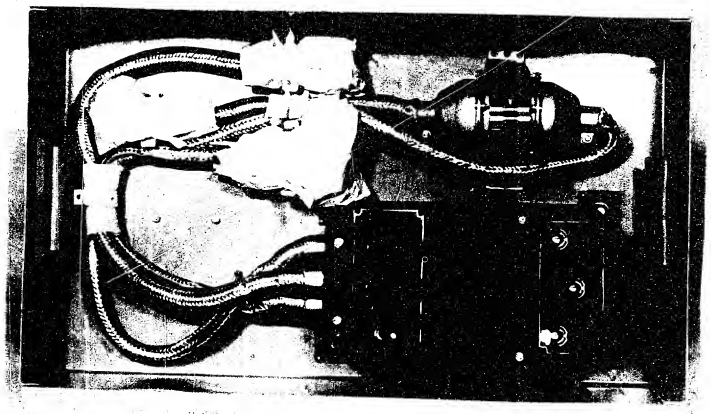


Fig.2. K-1 Control Panel-to-Mounting Attachment

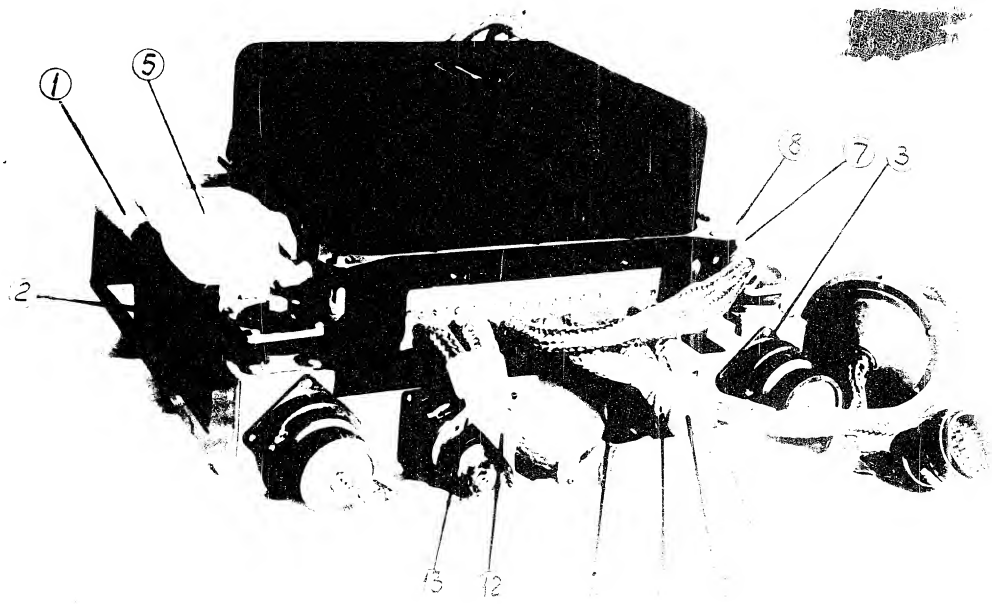

Fig.3. [illegible]-2 Gyro Unit-to-Mounting Attachment

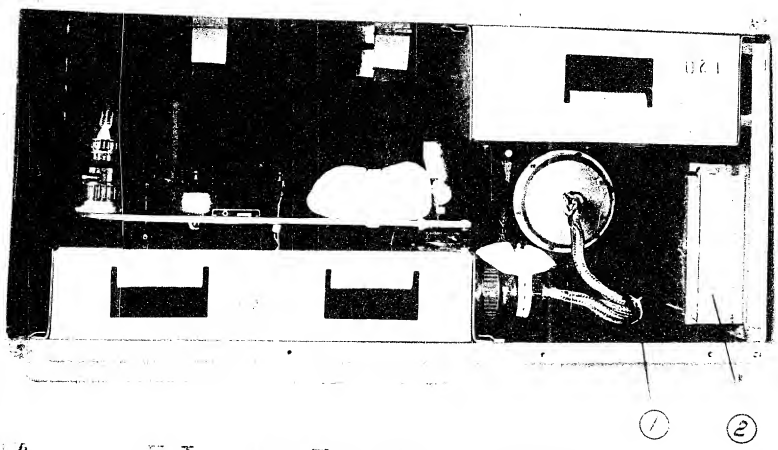

Fig.4. [illegible]-1 and [illegible]-2 Units in Tare

Prior to installation, place in each [illegible] bag (5, Fig.2 and 3) with "PCM" silica gel dehydrator [illegible] (TOCT 3956-47) and in the [illegible] bag (6, Fig.1) with blue silica gel indicator, [illegible] gr.

Place the silica gel bags so that they cannot shift during shipment. It is permitted to tie the bags to the cables or mounting with the [illegible] cord or fasten them by tapes with buttons.

NOTES: 1. When placing the bags in the cases silica gel dehydrator humidity must not exceed 2%.

2. The silica gel dehydrator type [illegible] may be substituted by silica gel type "KSM" (GOST 3956-47).

3. If a cartridge with silica gel indicator is placed in the case, the bag [illegible] with silica gel indicator should not be put in the case.

4. When packing the [illegible]-2 cable-set (manufactured with plug No.42) which is incorporated in the autopilot set installed in the [illegible] missile, place in the case the cap for the above mentioned plug, attach the plug to the clamp (6, Fig.2).

On accomplishing the packing, furnish the case with a packing list of a given standard, close the lid with the cover, fasten the latter with 14 bolts, secure the case with two seals 1050.56 at the corners located obliquely and mark with an indelible black paint the number of the autopilot set on the right upper corner of the cover and top wall of the case.

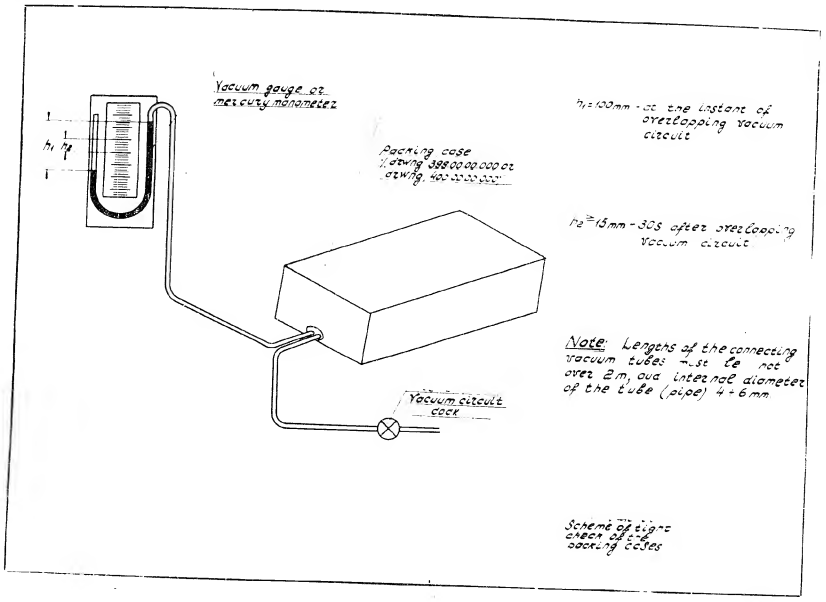

Fig.6 Testing the packing cases for tightness.

Install the [illegible] servo units (3, 4a) on the mounting (1, Fig.6) and secure each unit by 4 bolts with nuts.

Coat the [illegible] servo units output shafts with ZhTKO[illegible] lubricant.

Install the [illegible] timer on the mounting (2) and secure it by 4 screws with nuts.

Wrap each plug connector of the [illegible] servo units and P-ISOMO timer cables with two sheets of oil paper or herringbone tape and tie the tape with linen thread.

Insert the plug connectors in the holders (3). Fasten the [illegible] servo units to the clamps (4). Secure the cables by the tape with the buttes (7).

Tighten the [redacted] inverters (2 ea) to the mounting (1, Fig.7) by the screws with nuts, wrap the end caps and plug connectors of the inverters with two sheets of oil paper (Fig.7) and tie the oil paper with linen threads.

Move the mountings with the P-4 servo units and P-1810 timer and mounting with the [redacted] inverters into the case using the guide rails (Fig.8).

The mounting should move along the guide rails without shaking and sticking.

If necessary, bend the rails. The mountings must be moved into the case placed on the floor in the vertical position.

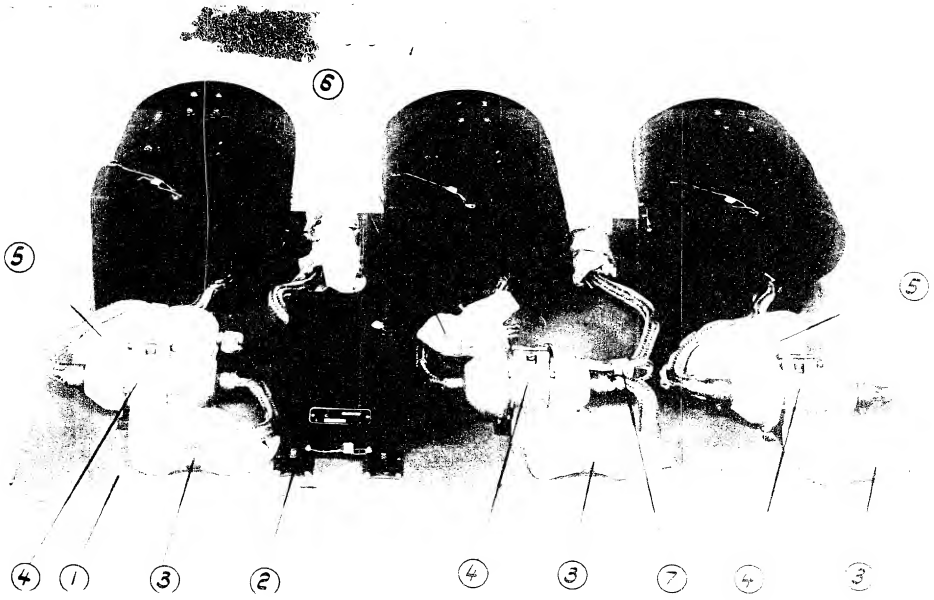

Fig. [redacted] P-4 servo units and [redacted] floor mounting attachment

Fig.7. MAI-1CA Inverter-to-Mounting Attachment

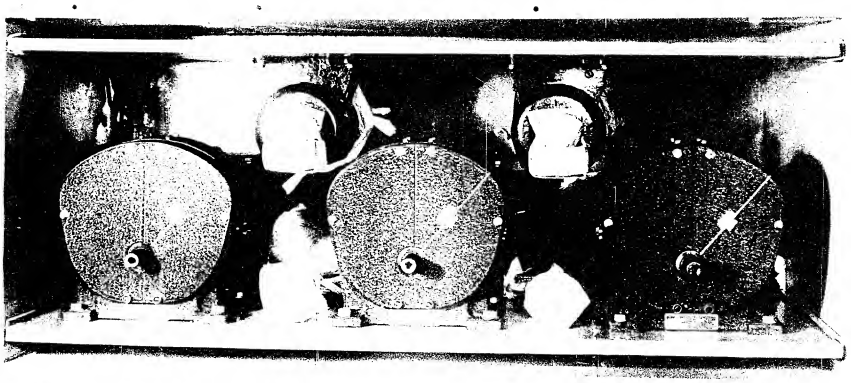

Fig.8. [illegible] Servo Units, M-1800 Timer and MAI-1CA Inverters Installed in Vare.

Before installing the mountings, place on the mounting with A-4 servo units and A-15MO timer two bags (5) with "KCM" silica gel dehydrator, 200 grm. each and the bag (6) with a blue silica gel - indicator, 15-20 grm. The bags must be placed so that they are not moved during transportation. It is permitted to tie the bags to the cables with linen threads or secure them by tapes with buttons (Fig.6).

NOTES: 1. When placing the silica gel dehydrator bags in the tare, silica gel humidity must not exceed 2%.

2. The silica gel type "KC" may be substituted by silica gel type "MCM", "KSK" and "TGT".

3. If a special cartridge with silica gel-indicator is installed in the case, the bag (6) with silica gel-indicator must not be placed in the case.

On accomplishing the packing, furnish the case with the packing list of a given standard, close the case with the cover, attach the case cover with 14 bolts, secure the case with two seals 1053A55 at two corners located obliquely (Fig.1) and mark with an indelible black paint the number of the autopilot set in the right upper corner of the cover and upper wall of the case.

Test the case welded seams tightness and tightness fitness of the cover in the same way as for the case with A-7 and A-2 units (see step 3).

NOTE: When packing the autopilot in the using organization it is permitted, as an exception, not to put the silica gel bags in the case and to test the case for airtightness.

2. INSTRUCTIONS FOR PACKING THE AUK-53 AUTOPILOT UNITS IN SHIPPING BOXES

1. To transport the AUK-53 autopilot set or its individual units, the metal cases are additionally placed in the wooden shipping boxes manufactured according to dwg. No.464.00.00.000.

2. When packing the autopilot set in the shipping boxes, proceed as follows:

Open the upper cover of the shipping box. Carefully, without jerks and shocks, place the metal case in the shipping box so that the case position would correspond to the inscriptions made on the case.

Placed between the walls of the shipping box and metal case are plywood and felt spacers to prevent the metal case from shifting inside the wooden box (Fig.9).

Close the upper cover, secure the box with four iron strips and two seals 1053A55.

On accomplishing the packing, mark with an indelible black paint the number of the autopilot set in the right upper corner of the cover.

NOTE: When packing the M-2 gyro unit incorporated in the autopilot set installed in the "K" missile, additionally mark on the case cover the number of the "K" missile in which the M-2 gyro unit is to be installed.

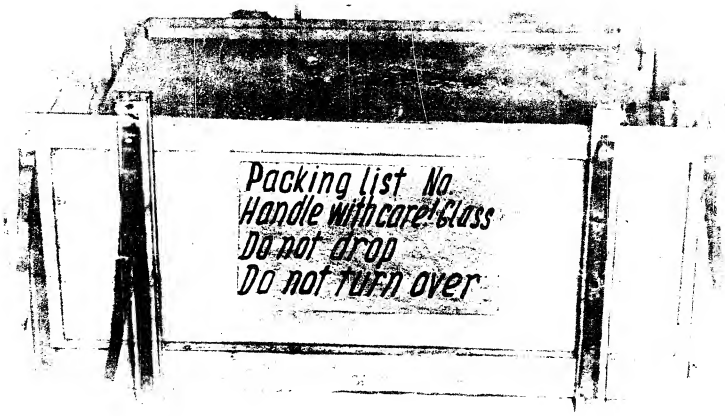

Fig.9. Packing Case in a Shipping Box

3. AM-1B AUTOPILOT UNPACKING INSTRUCTIONS

1. When unpacking the shipping boxes, proceed as follows.

Check for presence of seals on the box. Remove the iron strips and upper cover of the shipping box.

Take out the plywood and roll spacers placed between the wooden box and metal case. Carefully remove the metal case from the wooden box so that the metal case position would correspond to the inscriptions made on the case.

2. Unpack the packing cases with the I-1 and I-2 units as follows:

Check the case for freedom from damages and for presence of seals.

Break the seals and unscrew 14 bolts attaching the side wall. Make sure that the packing list is furnished. Check for presence of units and their numbers according to the packing and completing lists.

Inspect the silica gel-indicator. If the silica gel-indicator has become pink, replace the silica gel-indicator and silica gel dehydrator before a repeated packing.

NOTE: The autopilot units stored in the cases with pink silica gel-indicator should not be subjected to special checks; the units serviceability is determined during the next periodic check.

Remove the tape with the button securing cables No.45 and 47 to cable No.44.

Simultaneously take the mountingswith the II-I and II-2 units out of the case so that the units would be in the horizontal position.

Disconnect the II-2 gyro unit plug connector No.44 from the flange located on the mounting with the II-I unit and release the II-2 gyro unit filter from the clamp located on the same mounting.

Remove the tapes with the buttons, securing the cables and unscrew the remaining plug connectors of the II-2 gyro unit from the mounting flanges.

Remove the silica gel bags.

Unscrew 3 bolts and remove the II-2 gyro unit from the shock-mounts of the mounting. Move the mounting in the case along the guide rails. Unscrew the screw of the clamp, release the II-I control panel filter and take out the II-I

control panel plug connectors from the holders. Remove the tapes with buttons securing the cables.

Remove the herringbone tape and oil paper from the plug connectors.

Unscrew four screws and remove the П-I control panel from the mounting shock-mounts. Move the mounting in the case along the guide rails.

Attach the side wall by 2 bolts and place the remaining 12 bolts inside the case.

2. Unpack the cases with the П-4 servo units, П-16КО timer and ПАП-16А inverters as follows:

Check the case for freedom from damages and for presence of seals.

Break the seals and unscrew 14 bolts attaching the side wall. Make sure, that the packing list is furnished. Check the units and their numbers according to the packing and completing lists. Inspect the silica gel indicator. If the silica gel has become pink, replace the silica gel-indicator and silica gel-dehydrator before a repeated packing.

NOTE: The autopilot units, stored in the cases with a pink silica gel, should not be subjected to special checks; the units serviceability is determined during the next periodic check.

Remove the mounting with the П-4 servo unit and П-16КО timer so that the units would be in the horizontal position. Remove the silica gel bags.

Unscrew the screws of the clamps, release the П-4 servo unit filters and take out the П-4 servo unit plug connectors from the holders.

Remove the tapes with buttons which secure the cables. Cut the threads, remove the herringbone tape and oil paper from the plug connectors.

Unscrew four screws and remove the П-15КО timer from the shock-mounts. Unscrew 4 bolts and remove the П-4 servo units from the mounting. Move the mounting into the case along the guide rails.

Take the mounting with the НАП-150А inverters out of the case. Cut the threads and remove oil paper from the end caps and plug connectors of the inverters. Unscrew 4 screws and remove the inverters from the mounting. Move the mounting into the case along the rails.

Attach the side wall by 2 bolts and place the remaining 12 bolts inside the case.

4. АПК-5В AUTOPILOT SHIPMENT

1. The АПК-5В autopilot and its individual units which are not installed in the "КС" winged missile must be shipped in a box according to the requirements indicated in par. 1 and 2, these Instructions.

2. When carrying, loading and shipping the boxes see that the position of the boxes corresponds to the inscriptions made on them. The boxes must be carefully carried and loaded without jerks and shocks.

When shipping, install and attach the boxes so as to protect them from falls, displacement and impacts against each other. Do not transport the autopilot and its individual units

7. The attachment parts must ensure secure attachment of the autopilot units in the missile throughout the entire service life. The autopilot units attachment parts and plug connectors must be securely locked.

8. Install and remove the autopilot units only with the electrical system de-energized.

9. The requirements for the autopilot test and attachment in and removal from the missile are given in the "AS" Series Missile Maintenance and Operating Instructions, Vol. 1.

6. CHECKING THE [illegible]

1. Inspect the packing case [illegible] of damage. Open the case [illegible] in accordance with the instructions given in part. 2. Visually inspect all the units. Check the external surfaces of the units and cables for freedom from damage and traces of corrosion.

When checking the [illegible] proceed as follows.

2. Set the [illegible] to the [illegible] simulator case and [illegible]

3. Set the "[illegible]" [illegible] in the "OFF" position.

Connect a supply [illegible]

[illegible] units to be tested [illegible]

Set the "PANEL" selector switch in the "П-4" position, "WINDINGS SELECTOR SWITCH" - in the "0" position and "SIGNAL" selector switch-in the "60mA" position. Set the "SIGNAL" knob in the "0" position.

4. Switch on the "FEEDBACK" and "POWER" switches. The П-4 servo unit outlet shaft should move to the zero position. Attach the КИА-5 simulator pointer to the outlet shaft, aligning the pointer with the scale zero division. Set the "POWER" switch in the "OFF" position.

Manually turn the servo unit outlet shaft in any direction to the stop. Switch on the "POWER" switch; in this case the П-4 servo unit outlet shaft must move to the zero position to within $\pm 0.25^{\circ}$; self-oscillations should not appear. Repeat the check with the servo unit outlet shaft turned in the opposite direction.

5. Set the "FEEDBACK" switch in the "OFF" position, the "WINDING SELECTOR SWITCH" - in the "I" position and the "SIGNAL" selector switch-in the "3mA" position (for the КП-I control panels, whose "SIGNAL" milliammeter has the scales of "3-0-3mA", "60-0-60mA"). Smoothly turn the "SIGNAL" knob to the right, increase the control signal till the servo unit outlet shaft starts steadily rotating and moves to the limit switch (turning through an angle of 10-11° from the zero position). The control signal value (in mA) is the unit sensitivity.

When using the КП-I control panel whose "SIGNAL" milliammeter has the scales of "I-0-1mA", "1.5-0-1.5 mA", "2.5-0-2.5mA" and "60-0-60mA", check as described above except for the position of the "SIGNAL" selector switch which must be set before the check in the "1mA" position. If, when turning the "SIGNAL" knob, the

Set the "PANEL" selector switch to the " - " position, "WINDINGS SELECTOR SWITCH" - to the "0" position and "SIGNAL" selector switch in the "60-0-60" position. Set the "BALANCE" knob in the "0" position.

4. Switch on the "SERVO" and "MAINS" switches. The II-4 servo unit output shaft should take up the zero position. Attach the III-6 potentiometer pointer to the output shaft aligning the pointer with the zero mark. Switch on the "POWER" switch in the "on" position.

Manually turn the output shaft to the stop. Switch on the "SERVO" switch. The II-4 servo unit output shaft must move to within ± .5°; self-oscillation must not occur. Repeat the check with the output shaft moving in the opposite direction.

5. Set the "PANEL" selector switch to the "WINDINGS SELECTOR SWITCH" to the "SIGNAL" selector switch to the control panels, check the "2-0.3mA", "7-0-7mA" the right, first one then the left shaft should turn through (turning through an angle of

The control signal value

When using the III-6 potentiometer pointer the scale has the scales of "60-0-60mA", check as described above for the "2-0.3mA" the "SIGNAL" selector switch which must be set before the check in the "1mA" position. If, when turning the "SIGNAL" knob, the

Set the "PANEL" selector switch [illegible] position, "WINDINGS SELECTOR SWITCH" - in the [illegible] position and [illegible] selector switch in the "OUT" position. [illegible] in the "O" position.

4. Switch on the [illegible] The II-4 servo [illegible] tion. Attach the [illegible] aligning the pointer [illegible] "POWER" switch in the [illegible] position.

Manually turn the servo [illegible] to the stop. Switch on the [illegible] II-4 servo unit outlet shaft must [illegible] to within ± [illegible]° [illegible] the check with the servo [illegible] the opposite direction.

5. Set the [illegible] "WINDING SELECTOR SWITCH" [illegible] "SIGNAL" selector switch [illegible] control panels, whose [illegible] "3-0.3mA", "[illegible]" [illegible] the right, in [illegible] let shaft [illegible] (turning through [illegible]

The control [illegible]

[illegible]

[illegible]

Set the "[illegible]" selector switch to the "[illegible]" position, "[illegible]" selector switch in the "[illegible]" position, and the "[illegible]" in the "0" position.

4. Switch on the [illegible]. The E-4 servo unit switch [illegible] tion. Attach the E-4 [illegible] aligning the pointer with the [illegible] "POWER" switch to the "ON" position.

Manually turn the [illegible] to the stop. Switch on the [illegible] E-4 servo unit switch [illegible] to within ±.25°; switch off, [illegible] the check with the servo [illegible] opposite direction.

5. Set the [illegible] "[illegible]" selector switch to the [illegible] control panels, whose [illegible] "3-0.3mA", "60-0-60mA", and [illegible] the right, [illegible] let shaft starts steadily [illegible] (turning through an angle of [illegible]

The control signal value [illegible]

Then using the [illegible] bus the scales of [illegible] "60-0-60mA", shaft of [illegible] the "SIGNAL" selector switch [illegible] in the "ON" position. If, then turning the [illegible]

control signal value, at which the shaft starts rotating, exceeds 1mA, it is necessary to set the "SIGN.P" selector switch in the "1.5mA" position and if these values are exceeded, set the selector switch in the "2.5mA" position.

Repeat checking with the "SIGN.P" knob turned to the left. The servo unit outlet shaft should move to the opposite limit switch.

When setting to zero, the [illegible] in the position "0", [illegible] sensitivity. For the other [illegible] OF SWITCH" in the "1", [illegible] unit sensitivity must be [illegible] - 0.95-1.05 v.

6. [illegible] selector switch in the [illegible] SEN.ZERO.OFF.V. - in the [illegible]

Gradually [illegible] the "SIGNAL" [illegible] smoothly without jerks.

Repeat the check [illegible] by. Set the [illegible] the [illegible] servo [illegible]

7. Check the [illegible] subsystem [illegible]

Check the "SIGNAL" [illegible]

8. Set the [illegible] control panel [illegible] SWITCH" in the "0" position.

Connect a supply of 36 V a.c. to the control panel.

Connect the control panel cable to the plug connector of one of the NAT-1BA inverters.

9. Switch on the "POWER" and "LOAD" switches.

The gyro motors installed in the control panel must start rotating. After 3 min. check by the control panel D.C. ammeter the current drawn by the inverter which under normal conditions must not exceed 2.9 A.

When checking the autopilot at a temperature different from the normal temperature within a range of -35°C to +50°C, increase the above mentioned tolerance by 0.06A for each 10°C of the temperature change either side from normal.

10. Set the "PHASE SELECTOR SWITCH" in the "1" position. Check A.C. voltage generated by the inverter using the control panel A.C. voltmeter and the alternating current generated by the inverter using the control panel A.C. ammeter. Under normal conditions voltage should be equal to 36±4 V and current should not exceed 2.5 ± A.

When checking at a temperature different from the normal temperature within a range of -35° to +50°C, increase the 4 V tolerance of the voltmeter readings by 0.2 V for every 10°C of the temperature change either side from normal.

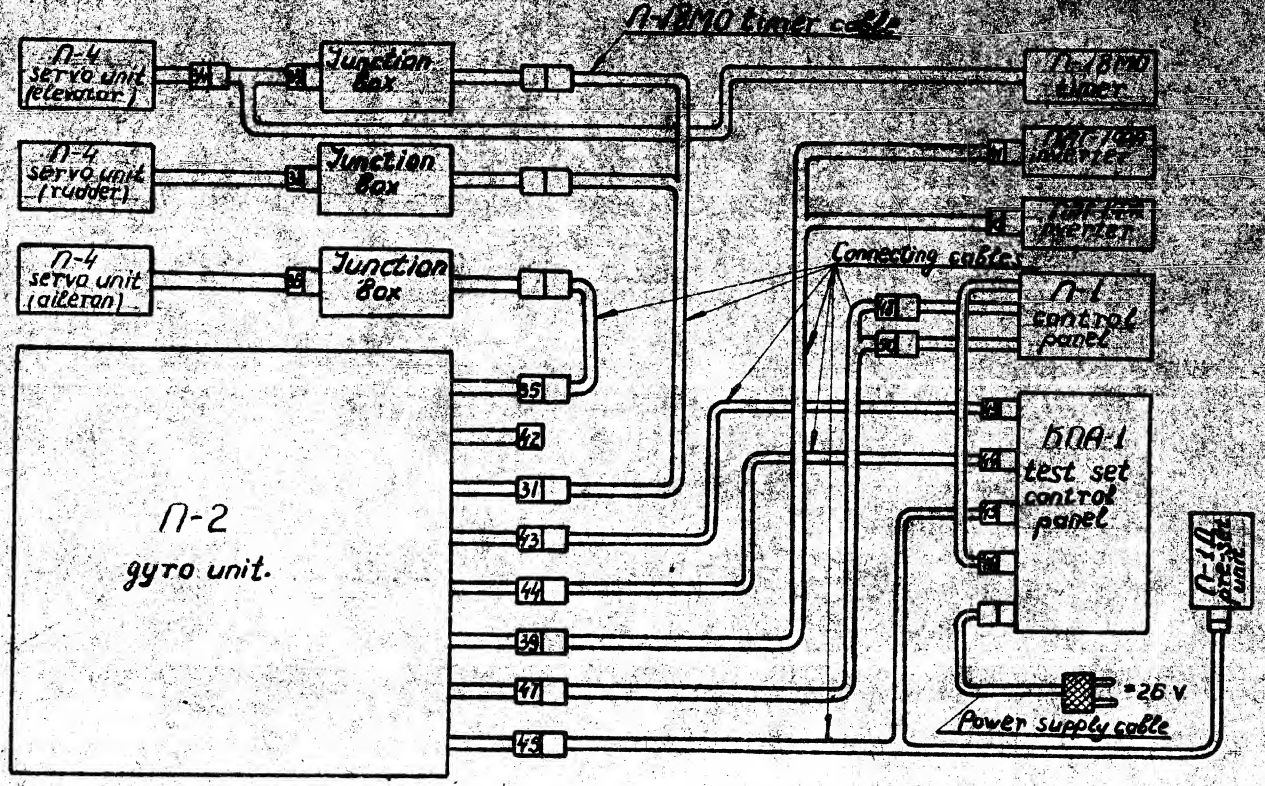
In the temperature range indicated below and other similar conditions the tolerance for the ammeter, must be increased:

at T=+20 to -35°C by 0.054 A

at T=+20 to +50°C by 0.042 A.

Set the "PHASE SELECTOR SWITCH" in the "2" and "3" positions and check voltage and current in two other phases of the inverter.

nt No 12 to АПК-5В autopilot specifications.



: Plug connectors are arbitrarily designated.

Fig. 10. Block diagram of ATT-32 autopilot Unit's Connection with Test set.

Attach the KUM-5 simulator pointers to the П-4 servo unit outlet shafts and set the cursors at zero points on the simulator scales.

NOTES: a) Before energizing the autopilot, check the "CENTERING" potentiometer wipers position on the Ш-1 control panels in this case the slot on the potentiometer shaft must be against the index on the panel cover.

b) After illumination of the "READY GO" warning lights but not earlier than 3 min. after power is applied, set the selector switch on the Ш-1 panel in the "LIGHT" position. Set the "SERVO-S TEST" knob of the Ш-1 panel in the 1 deg. "UP" position, the milliammeter pointer on the Ш-1 panel must deflect "UP", approx. one division. Press the "LANDING" button on the КИА-1 control panel, the "READY" warning light must go out and the "LANDING" warning light must come on, the elevator simulator pointer must deflect 1°±21' to the left. Turn the "ЭЛЕВ-ЭКВ UNIT" knob of the Ш-1 panel in turn to the left and to the right. The pointers of the elevator simulator and milliammeter on the Ш-1 panel must be reversible. Set the "ЭЛЕВ-ЭКВ UNIT" knob on the Ш-1 panel in the zero position and change the selector switch from the "LIGHT" position to the middle position.

the SPZ power supply on the side-
control panel and alter S-1L etc.
energize the weighted gain. Last,
with the "Start Check" normal light
cross on.

c) When the "Start Check" normal light
is also lit, repeat the above
procedure to check with the pre-
amp gain knob on radio panel
set at 0°, A°, 1° and 2° positions.
In this case the normal indica-
tor lights will not go out when going
to the 1° value and above, the pre-amp
will be bypassed.

Next the knob on radio panel
should be set down to the 1°,
2°, 3°, 4° and 5° steps, and
at each the noise level on the
"Start Check" meter must be
the same duplicate readings must be.
The noise level must never rise above the
normal set noise level.

NOTE: 1. When checking the Hi-A panel pre-set
knob with the knob set to the right
to the range of 0° to 2°, the "Start
Check" warning light may remain illu-
minated.

2. When switching over to the A-37B

[illegible] the [illegible] power supply on the [illegible] control panel [illegible] after 5-10 secs. energize the multiplier gain. Wait, until the "Gain Set" warning light comes on.

c) When the "Ready" warning light is lit brightly, repeat the check procedure as above with the pre-set unit knob on the "A" panel set on the 2°, 4°, 6° and 8° positions. At each of these positions the control should be checked and adjusted to within ±3% of the value indicated by the pre-set unit on the "A" panel.

Repeat the above for the "B" panel pre-set unit knob set down in the 1°, 3°, 5°, 7° and 9° positions, as [illegible] the multiplier on the "B" panel [illegible] the [illegible] surface simulator must def. [illegible] the right (as viewed from the nose of the [illegible]).

[illegible] 5. When turning the "B" panel pre-set unit knob to the left or to the right in the range of 1° to 2°, the "BASES HERE" warning light may remain illuminated.

6. When switching over to the A-17K

simulator, the direction indicator in the [illegible] model is inoperative.

[illegible], after the "Preheat" warning lights come on(but not earlier than 3 min. after power is supplied) set the [illegible] on the control panel in the "BOARD [illegible]" position and switch on the "[illegible]" switch.

The "BOARD [illegible]" and "[illegible]"warning lights must come on. Supply self-[illegible] gyro unit in direction; at the instant of turning the [illegible] gyro unit, the [illegible]-4 rudder servo unit outlet shaft must turn. Repeat the check when turning the [illegible] unit in the opposite direction.

Perform similar checks when turning the [illegible] gyro unit [illegible].

In rotation of the [illegible] servo unit shafts relative to [illegible] indicated in Table No.1, the positions of the control [illegible] position indicators, when the [illegible]-4 gyro unit is turned in the [illegible] indicated in Table No.1, must move [illegible].

Table No.1.

Channel	Direction of [illegible] gyro unit turn	Direction of outlet shafts rotation		
		[illegible] rudder servo unit	[illegible]-4 elevator servo unit	[illegible]-4 aileron servo unit
Direction	to the right	counter-clockwise	-	-
Pitch	up	-	clockwise	-
Roll	to the right	-	-	clockwise

NOTE: After the [illegible]-gyro unit is stopped, the [illegible]-4 servo unit outlet shafts must return to the zero position to within $\pm 0.25^{\circ}$.

15. Fully turn the "[illegible]" knob on the control panel to the "RIGHT". The [illegible] rudder servo unit outlet shaft must smoothly, without jerks, turn clockwise and the [illegible] aileron servo unit outlet shaft - counterclockwise. Fully turn the "RUDDER" knob to the "LEFT". The [illegible] rudder servo unit outlet shaft must smoothly, without jerks, turn counterclockwise and the [illegible] aileron servo unit outlet shaft - clockwise. Set the "RUDDER" knob in the zero position.

Fully turn the "[illegible]" knob on the control panel to the "UP" position.

The [illegible] elevator servo unit outlet shaft must smoothly, without jerks, turn counterclockwise. Fully turn the "ELEVATOR" knob to the "[illegible]" position. The [illegible] elevator servo unit shaft must smoothly, without jerks, turn clockwise. Set the "[illegible]" knob in the zero position and the "[illegible]" switch in the "[illegible]" position. Wait till the [illegible] servo units outlet shafts move to the zero position and "[illegible]" warning lights come on.

17. Set the "[illegible]" in the "[illegible] SIMULATOR" position. The "[illegible] SIMULATOR" warning light must become illuminated. Press the "UNCAGING" button on the control panel and simultaneously start the stop-watch; in this case the "CAGE" warning light must go out and "UNCAGE" warning light must come on. 2-3 sec. after the "UNCAGING" button is pressed, the [illegible] elevator servo unit outlet shaft must turn counterclockwise through an angle of 9-9.5° and 40-42 sec. after the button is pressed, the outlet shaft must return to the zero position to within ±0.55°. Perform the check twice. When uncaging for the first time, check the [illegible] servo

power of 28.6 V D.C. to the control panel. Set the "PANEL" selector switch in the [redacted] position, the "WINDING SELECTOR SWITCH" - in the "0" position and the "SIGNAL" selector switch - in the "COMM" position. Set the "SIGNAL" knob in the "0" position.

3. Switch on the "POWER" and "FEEDBACK" switches, in this case the [redacted] aileron servo unit shaft must turn to the zero position.

Check the ailerons position. If the ailerons are deflected from the neutral position(i.e. the ailerons neutral position does not correspond to the zero position of the [redacted] servo unit) set the ailerons in the neutral position by changing the rods length using the adjustment elements.

4. Set the "FEEDBACK" switch in the "OFF" position and "WINDING SELECTOR SWITCH" - in the "I" position. Slowly rotating the "SIGNAL" potentiometer knob, first in one and then in the other side of zero position, determine the ailerons maximum angle of deflection (till the [redacted] servo unit limit switches are actuated) which must be within ±9.5 to 11.5° from the neutral position.

5. Set the "SIGNAL" knob in the "0" position, switch on the "FEEDBACK" switch and check that the ailerons are set in the neutral position again; in this case permissible angle of the ailerons deflection from the neutral position is up to 0.25°.

6. Set the "POWER" switch in the "OFF" position and manually deflect the ailerons in either side to the stop; then switch on the "POWER" switch, in this case the ailerons

must move to the neutral position and self-oscillations must not occur.

Repeat the check with the ailerons deflected to the opposite side. Set the "POWER" switch in the "OFF" position and disconnect the П-4 aileron servo unit plug connector from the control panel.

7. Check the П-4 rudder and elevator servo units for proper installation (steps 2-6).

NOTE: The elevator neutral position is the deflection through 2.5-3° up from the geometric neutral position. Further, this position of the elevator is called "ZERO" position.

8. TESTING THE АПК-5В AUTOPILOT AFTER INSTALLATION IN THE "КС" MISSILE

1. To check the АПК-5В autopilot after installing it in the "КС" missile, remove the П-2 gyro unit from the missile irrespective of the preservation to which the given "КС" missile will be subjected after it is accepted by the Customer.

2. Install the П-2 gyro unit on the КПА-5 turn table according to the instructions given in step 12, par.6.

NOTE: It is permitted to install the П-2 gyro unit on the КПА-5 turn table without removing the gyro unit from the mounting.

3. Place the П-2 gyro unit secured to the turn table at a distance of 1-2.5 m. from the access door in the fuselage bottom section between frames 14 and 18.

NOTE: When installing the turn table see that it does not slide on the base.

4. Connect the П-2 gyro unit plug connectors observing the numbers on the plug connectors and the autopilot wiring diagram (Fig.11), in this case:

a) connect the П-2 gyro unit receptacles No.31, 35,39,43 and 47 to the mating plugs of the missile wiring system through the connecting cables;

b) connect the П-2 gyro unit receptacle No.4 to the mating plug of the ПИА-I control panel through the connecting cable; the ПИА-I control panel plug connector No.43 through the connecting cable – to the plug connector No.36 used for checking the autopilot installed in the missile and the П-2 gyro unit plug connector No.42 – to the ПИА-I and П1-3 control panels through the connecting cable according to the block diagram given in Fig.10.

NOTES: 1. Do not connect plug connectors when the system is energized.

2. Connect the autopilot to the missile electrical system to check it only after the missile wiring system is approved by the Quality Inspection Department and by the Customer.

When checking the autopilot operation, proceed as follows:

5. Supply power of 28±0.5 V d.c. to the missile electrical system. Switch on the "POWER" switch on the control panel. In this case the ПИА-I "Inverter's short circuit" warning lights are lighted then after the "Inverter" warning light goes out. Do not check operation of the "Inverter" warning light.

The rudder and ailerons must be set in the neutral positions to within $\pm 0.5^{\circ}$ and the elevator must be set $2.5-3^{\circ}$ up from the geometric neutral position (further, this position of the elevator is called a "ZERO" position). The control surfaces position indicators pointers must be in the middle positions.

a) After the "BASES ZERO" warning lights become illuminated, but not earlier than 3 min. after power is supplied, set the "B" selector switch on the ПП-Д control panel in the "TO THE RIGHT" position. Set the pre-set unit knob on the ПП-Д control panel in the position 4 divisions down. The pointer of the milliammeter on the ПП-Д panel must deflect down approx. 4 divisions. The "BASES ZERO" warning light on the КПА-1 control panel must go out. Press the "UNCAGING" button; the elevator must move through an angle of $4^{\circ} \pm 1^{\circ} 24'$ down from the initial position.

Turn the pre-set unit knob on the ПП-Д control panel "UP", "DOWN" and then set it in the zero position.

The elevator must be motionless. Set the selector switch on the ПП-Д control panel in the middle position.

De-energize the autopilot. Repeat the check with the pre-set unit knob set in the 3° and 6° positions.

b) Repeat the check as specified in step "a" with the pre-set unit knob set 4° "UP". In this case the elevator must move through an angle of $4^{\circ} \pm 1^{\circ} 24'$ up.

4. If two stop-watches are available check the programmed operation at a single switching-on of the M-18M timer.

9. Check how the control surfaces are controlled by the free gyros: smoothly turn the П-2 gyro unit through an angle of $\pm 5^{\circ}$ in yaw, $\pm 25^{\circ}$ in pitch and $\pm 40^{\circ}$ in roll. The control surfaces must smoothly, without jerks, deflect in accordance with Table No.4.

When stopping the П-2 gyro unit being deflected, the control surfaces and ailerons must not return to the neutral positions.

NOTE: Before checking the pitch control, turn the gyro unit in pitch, with the free gyros caged, through an angle of 10° in the direction opposite to that checked. Then, one minute after the autopilot is uncaged, check the control system. Perform a similar check with the unit turned in the opposite direction; proceed as specified in this note if the turn table does not permit turning the П-2 unit in pitch within $\pm 25^{\circ}$.

Table No.4

Channel	Direction of П-2 gyro unit turn	Direction of deflection		
		Rudder	Elevator	Ailerons
Direction	to the right	to the left	-	right aileron down
Pitch	up	-	down	-
Roll	to the right	-	-	right aileron down

4. If two stop-watches are available check the programmed operation at a single switching-on of the M-18M timer.

9. Check how the control surfaces are controlled by the free gyros: smoothly turn the M-3 gyro unit through an angle of $\pm 45^{\circ}$ in yaw, $\pm 25^{\circ}$ in pitch and $\pm 40^{\circ}$ in roll. The control surfaces must smoothly, without jerks, deflect in accordance with Table No.4.

When stopping the M-3 gyro unit being deflected, the control surfaces and ailerons must not return to the neutral positions.

NOTE: Before checking the pitch control, turn the gyro unit in pitch, with the free gyros caged, through an angle of 10° in the direction opposite to that checked. Then, one minute after the autopilot is uncaged, check the control system. Perform a similar check with the unit turned in the opposite direction; proceed as specified in this note if the turn table does not permit turning the M-3 unit in pitch within $\pm 25^{\circ}$.

Table No.4

Channel	Direction of M-3 gyro unit turn	Direction of deflection		
		Rudder	Elevator	Ailerons
Direction	to the right	to the left	-	right aileron down
Pitch	up	-	down	-
Roll	to the right	-	-	right aileron down

4. If two stop-watches are available check the programmed operation at a single switching-on of the [redacted]-12M timer.

9. Check how the control surfaces are controlled by the free gyros: smoothly turn the [redacted]-5 gyro unit through an angle of $\pm 5^{\circ}$ in yaw, $\pm 25^{\circ}$ in pitch and $\pm 40^{\circ}$ in roll. The control surfaces must smoothly, without jerks, deflect in accordance with Table No.4.

When stopping the [redacted]-5 gyro unit being deflected, the control surfaces and ailerons must not return to the neutral positions.

NOTE: Before checking the pitch control, turn the gyro unit in pitch, with the free gyros caged, through an angle of 10° in the direction opposite to that checked. Then, one minute after the autopilot is uncaged, check the control system. Perform a similar check with the unit turned in the opposite direction; proceed as specified in this note if the turn table does not permit turning the [redacted]-5 unit in pitch within $\pm 25^{\circ}$.

Table No.4

Channel	Direction of [redacted]-5 gyro unit turn	Direction of deflection		
		Rudder	Elevator	Ailerons
Direction	to the right	to the left	-	right aileron down
Pitch	up	-	down	-
Roll	to the right	-	-	right aileron down

4. If two stop-watches are available check the programmed operation at a single switching-on of the M-18M timer.

9. Check how the control surfaces are controlled by the free gyros: smoothly turn the M-2 gyro unit through an angle of $\pm 5^{\circ}$ in yaw, $\pm 25^{\circ}$ in pitch and $\pm 40^{\circ}$ in roll. The control surfaces must smoothly, without jerks, deflect in accordance with Table No.4.

When stopping the M-2 gyro unit being deflected, the control surfaces and ailerons must not return to the neutral positions.

NOTE: Before checking the pitch control, turn the gyro unit in pitch, with the free gyros caged, through an angle of 10° in the direction opposite to that checked. Then, one minute after the autopilot is uncaged, check the control system. Perform a similar check with the unit turned in the opposite direction; proceed as specified in this note if the turn table does not permit turning the M-2 unit in pitch within $\pm 25^{\circ}$.

Table No.4

Channel	Direction of the gyro unit turn	Direction of deflection		
		Rudder	Elevator	Ailerons
Direction	to the right	to the left	-	right aileron down
Pitch	up	-	down	-
Roll	to the right	-	-	right aileron down

4. If two stop-watches are available check the programmed operation at a single switching-on of the M-12MO timer.

5. Check how the control surfaces are controlled by the free gyros: smoothly turn the M-2 gyro unit through an angle of $\pm 45^{\circ}$ in yaw, $\pm 25^{\circ}$ in pitch and $\pm 40^{\circ}$ in roll. The control surfaces must smoothly, without jerks, deflect in accordance with Table No.4.

When stopping the M-2 gyro unit being deflected, the control surfaces and ailerons must not return to the neutral positions.

NOTE: Before checking the pitch control, turn the gyro unit in pitch, with the free gyros caged, through an angle of 10° in the direction opposite to that checked. Then, one minute after the autopilot is uncaged, check the control system. Perform a similar check with the unit turned in the opposite direction; proceed as specified in this note if the turn table does not permit turning the M-2 unit in pitch within $\pm 25^{\circ}$.

Table No.4

Channel	Direction of M-2 gyro unit turn	Direction of deflection		
		Rudder	Elevator	Ailerons
Direction	to the right	to the left	-	right aileron down
Pitch	up	-	down	-
Roll	to the right	-	-	right aileron down

4. If two stop-watches are available check the programmed operation at a single switching-on of the П-18М timer.

9. Check how the control surfaces are controlled by the free gyros: smoothly turn the П-2 gyro unit through an angle of ±5° in yaw, ±25° in pitch and ±40° in roll. The control surfaces must smoothly, without jerks, deflect in accordance with Table No.4.

When stopping the П-2 gyro unit being deflected, the control surfaces and ailerons must not return to the neutral positions.

NOTE: Before checking the pitch control, turn the gyro unit in pitch, with the free gyros caged, through an angle of 10° in the direction opposite to that checked. Then, one minute after the autopilot is uncaged, check the control system. Perform a similar check with the unit turned in the opposite direction; proceed as specified in this note if the turn table does not permit turning the П-2 unit in pitch within ±25°.

Table No.4

Channel	Direction of П-2 gyro unit turn	Direction of deflection		
		rudder	elevator	ailerons
Direction	to the right	to the left	-	right aileron down
Pitch	up	-	down	-
Roll	to the right	-	-	right aileron down

4. If two stop-watches are available check the programmed operation at a single switching-on of the [redacted] timer.

5. Check how the control surfaces are controlled by the free gyros: smoothly turn the [redacted] gyro unit through an angle of $\pm 45^{\circ}$ in yaw, $\pm 25^{\circ}$ in pitch and $\pm 40^{\circ}$ in roll. The control surfaces must smoothly, without jerks, deflect in accordance with Table No.4.

When stopping the [redacted] gyro unit being deflected, the control surfaces and ailerons must not return to the neutral position.

NOTE: Before checking the pitch control, turn the gyro unit in pitch, with the free gyros caged, through an angle of 10° in the direction opposite to that checked. Then, one minute after the autopilot is uncaged, check the control system. Perform a similar check with the unit turned in the opposite direction; proceed as specified in this note if the turn table does not permit turning the [redacted] unit in pitch within $\pm 25^{\circ}$.

Table No.4

Channel	Direction of [redacted] gyro unit turn	Direction of deflection		
		Rudder	Elevator	Ailerons
Direction	to the right	to the left	-	right aileron down
Pitch	up	-	down	-
Roll	to the right	-	-	right aileron down

4. If two stop-watches are available check the programmed operation at a single switching-on of the П-16М timer.

9. Check how the control surfaces are controlled by the free gyros: smoothly turn the П-2 gyro unit through an angle of $\pm 45^{\circ}$ in yaw, $\pm 25^{\circ}$ in pitch and $\pm 40^{\circ}$ in roll. The control surfaces must smoothly, without jerks, deflect in accordance with Table No.4.

When stopping the П-2 gyro unit being deflected, the control surfaces and ailerons must not return to the neutral positions.

NOTE: Before checking the pitch control, turn the gyro unit in pitch, with the free gyros caged, through an angle of 10° in the direction opposite to that checked. Then, one minute after the autopilot is uncaged, check the control system. Perform a similar check with the unit turned in the opposite direction; proceed as specified in this note if the turn table does not permit turning the П-2 unit in pitch within $\pm 25^{\circ}$.

Table No.4

Channel	Direction of П-2 gyro unit turn	Direction of deflection		
		Rudder	Elevator	Ailerons
Direction	to the right	to the left	-	right aileron down
Pitch	up	-	down	-
Roll	to the right	-	-	right aileron down

10. Set the "[illegible] CONTROL" to "ON" in the "A-14 SIMULATOR" position. The "A-14 SIMULATOR" warning light must come on.

Switch on the "[illegible] No.1" switch on the control panel. The "POWER No.1" warning light must become illuminated. When command No.1 is sent, the control surfaces may deflect from the position, assumed by them before the command is sent, through the angles within ±1.6° (elevator and ailerons) and ±6.5° (rudder).

Fully turn the "[illegible]" knob on the control panel to the "[illegible]". The rudder must deflect, without jerks, [illegible] the right side. Set the "RUDDER" knob in the zero position; in this case the rudder and ailerons must move to the neutral position.

Repeat the check with the "[illegible]" knob turned to the "[illegible]".

Fully turn the "ELEVATOR" knob on the control panel to the "up". The elevator must respond, without jerks, deflect upwards. Set the "ELEVATOR" knob in the zero position; in this case the elevator must move to the zero position. Repeat the check with the "ELEVATOR" knob turned to the "DOWN" position.

NOTE: The time, required for sending a signal of one polarity, should not exceed 15 sec.

11. Switch on the "POWER No.2" switch on the control panel. The "POWER No.2" warning light must become illuminated. Check how the control surfaces are controlled by the "RUDDER" and "ELEVATOR" pre-set knobs on the control panel in the same manner as when sending command No.1; in this case, when setting the "RUDDER" and "ELEVATOR" knobs in the zero positions, the control surfaces must [illegible] move to the neutral position.

12. Set the "[illegible] No.1" and "[illegible] No.2" switches in the "OFF" position and the "[illegible] SWITCH" on the control panel in the "[illegible] CONTROL" position. Set the "POWER" switch of the [illegible] control unit in the "OFF" position and if the autopilot has operated for more than 60 min.make an interval for not less than 30 min. to cool the [illegible] gyro unit.

13. Switch on the [illegible] control unit "POWER" switch.After the "[illegible] ZERO" warning light comes on (but not earlier than 3 min. after power is supplied) press the "UNCAGING" button on the control panel.

The "CAGE" warning light must go out and the "UNCAGE" warning light must come on.

After 5 min., check the autopilot free gyros precession. The gyros rigidity should be so,that the control surfaces deflection from the neutral position for 5 min. would not exceed:

rudder $\pm$ 1.25°

elevator $\pm$ 2.5°

ailerons $\pm$ 1.25°.

When checking the gyros rigidity, the [illegible] gyro unit must be in the horizontal position.

NOTE: The ailerons deflection depends also on the yaw free gyro precession (due to a signal picked up from the coordination potentiometer); therefore before determining the value of the roll free gyro precession, set the rudder in the neutral position by turning the [illegible] gyro unit in yaw. In this case the ailerons deflection from the neutral position corresponds to the roll gyro precession.

14. Set the "POWER" switch on the П-I control panel in the "OFF" position. Disconnect the П-2 gyro unit plug connectors and remove the unit from the turn table.

15. Make entries about the autopilot checks performed in the "КС" missile Log-Book.

16. Install the П-2 unit in the missile and check the autopilot operation as follows (steps 17-24).

17. Connect plug connector No.36 of the ground test panel to the autopilot board check plug connector No.36 via the connecting cable, control panel plug connector No.12 through the connecting cable to plug connector No.12 of the missile wiring system having disconnected this plug connector from the К1-13М unit and connect plug connector No.45 through the control panel connecting cable to plug connector No.45 of the П-2 gyro unit having disconnected it from the missile electrical system.

Switch off all the switches on the control panel, supply power of 28±0.5 V d.c. to the missile electrical system and +26 volts to the "+" terminal of the control panel.

18. Switch on the "POWER" switch on the П-I control unit. The ПАИ-1-4А inverters must start operating. The "CAGED" and "BASES ZERO" warning lights on the control panel must become illuminated.

The control surfaces should be set in the neutral position.

The indicator pointers on the control panel must be in the middle positions.

19. Switch on the "POWER" and "CHECK" switches on the control panel. Turn the "RUDDER" knob on the control panel

14. Set the "POWER" switch on the П-1 control panel in the "OFF" position. Disconnect the П-2 gyro unit plug connectors and remove the unit from the turn table.

15. Make entries about the autopilot checks performed in the "KC" missile Log-Book.

16. Install the П-2 unit in the missile and check the autopilot operation as follows (steps 17-24).

17. Connect plug connector No.36 of the ground test panel to the autopilot board check plug connector No.36 via the connecting cable, control panel plug connector No.12 through the connecting cable to plug connector No.12 of the missile wiring system having disconnected this plug connector from the К1-13М unit and connect plug connector No.45 through the control panel connecting cable to plug connector No.45 of the П-2 gyro unit having disconnected it from the missile electrical system.

Switch off all the switches on the control panel, supply power of 28±0.5 V d.c. to the missile electrical system and +26 volts to the "+" terminal of the control panel.

18. Switch on the "POWER" switch on the П-1 control unit. The ПАИ-1А inverters must start operating. The "CAGED" and "BASES ZERO" warning lights on the control panel must become illuminated.

The control surfaces should be set in the neutral position.

The indicator pointers on the control panel must be in the middle positions.

19. Switch on the "POWER" and "CHECK" switches on the control panel. Turn the "RUDDER" knob on the control panel.

14. Set the "POWER" switch on the [illegible] control panel in the "OFF" position. Disconnect the [illegible] gyro unit plug connectors and remove the unit from the turn table.

15. Make entries about the autopilot checks performed in the "KC" missile Log-Book.

16. Install the [illegible] unit in the missile and check the autopilot operation as follows (steps 17-24).

17. Connect plug connector No.36 of the ground test panel to the autopilot board check plug connector No.36 via the connecting cable, control panel plug connector No.42 through the connecting cable to plug connector No.42 of the missile wiring system having disconnected this plug connector from the K1-13V unit and connect plug connector No.49 through the control panel connecting cable to plug connector No.49 of the [illegible] gyro unit having disconnected it from the missile electrical system.

Switch off all the switches on the control panel, supply power of 28±1.5 V d.c. to the missile electrical system and +26 volts to the "+" terminal of the control panel.

18. Switch on the "POWER" switch on the [illegible] control unit. The [illegible] inverters must start operating. The "CAGED" and "BASES ZERO" warning lights on the control panel must become illuminated.

The control surfaces should be set in the neutral position.

The indicator pointers on the control panel must be in the middle positions.

19. Switch on the "POWER" and "CHECK" switches on the control panel. Turn the "RUDDER" knob on the control panel.

The rudder and ailerons must deflect. Turn the "RUDDER" knob in the opposite direction. The rudder and ailerons must move in the opposite direction. Set the "RUDDER" knob in the zero position. Turn the [illegible] knob on the control panel. The elevator and ailerons. Turn the "ELEVATOR" knob in the opposite direction. The elevator must deflect in the opposite direction. Set the "ELEVATOR" knob in the zero position.

Set the "MASTER" switch in the "ON" position. Wait till the control surfaces move to the neutral position and the "RISK DOWN" warning light comes on.

20. Press the "CHECKLIST" button on the control panel. The "RISK" warning light must go out and the "RISK DOWN" warning light must come on. Press the "CHECKLIST" button and hold it pressed for 5 seconds. In this case, the elevator must deflect up. Then the elevator returns to the initial position.

21. Watch on the [illegible] panel. The "GEAR DOWN" relay light must come on. Turn the "GEAR" knob on the control panel.

The rudder and ailerons must deflect.

Set the "GEAR" knob in the zero position. In this case the rudder and ailerons must move to the neutral position. Repeat the check when turning the "GEAR" knob in the opposite direction.

Turn the "FLAPS" knob on the control panel. The rudder must deflect. Set the "FLAPS" knob in the zero position; in this case the elevator must move to the neutral position. Repeat the check with the "FLAPS" knob turned in the opposite direction.

[illegible]: It is permitted to check how the autopilot responds to normal signals by selecting No.1 and No.2 (page 17-23) servo coupling, the signals coming directly from the [illegible] station. In this case do not disconnect plug connector No.1 from the [illegible] unit and the [illegible] unit on the [illegible] control panel instead of the [illegible] control panel.

9. [illegible]

The [illegible] autopilot output signals are not to be fed simultaneously from equipment on the [illegible] version; at the [illegible] plant.

Given below are the instructions for switching on signals.

1. Install the [illegible] unit on the [illegible] and connect the [illegible] plug connectors [illegible] and 2). Connect the [illegible] plug connector No.1 to the [illegible] connector on the [illegible] panel through the connecting cables.

Before the operation should be followed:

2. [illegible] switch of the control panel in the [illegible] position and turn on the [illegible] switch of the [illegible] control panel.

Connect the [illegible] to the [illegible] by a special cable - not more than [illegible] long - for the [illegible] plug connector [illegible] to the [illegible] terminal on the control panel and the [illegible] to the [illegible] terminal on the control panel.

After the "Ready Light" warning light has come on (but not earlier than 3 min. after power is applied) press the "INITIATE" button.

3. Setting the [illegible] "Test" switch (S "T") of the control panel in the "Right", "Left", and "Up-Down" positions in turn, measure the voltage, output signal from the free gyro and [illegible] servo unit feedback output signal by the voltmeter connected.

4. Measure as specified in step 3 with the [illegible]2 gyro unit turned about the vertical axis in the following succession:

to the right through the angles of: 1°, 2°, 6°, 8°, 11°;
reverse travel: 8°, 5°, 2°, 0°;
to the left through the angles of: 1°, 3°, 6°, 9°, 11°;
reverse travel: 8°, 5°, 2°, 0°.

Before removing with the [illegible] gyro unit turned to the left, cut off power supply to it for a short time until the "Ready" light of the [illegible] control panel has been send the "Initiate" command.

NOTE: Tests are as specified in steps 3 and 4 for not more than 4 min.

5. Set the "Test" switch on the [illegible] control panel in the "Off" position.

Enter the check results in the Table (at the end of section II.)

Adjust the pitch channel as follows:

6. Switch on the "Field" switch on the [illegible] control panel. Connect the "+" terminal of the D.C. voltmeter, indi-

[illegible] cated in step 2, to the [illegible] terminal on the control panel and [illegible] command [illegible] to the "Out" terminal on the control panel.

[illegible] the "Off" switch is turned on (but not earlier than [illegible] after [illegible] the [illegible] voltmeter to zero.

7. [illegible] the [illegible] on the control panel to the [illegible] position in turn, [illegible] volts, output signal from the [illegible] and [illegible] from output signal of the voltmeter [illegible].

8. [illegible] as specified in step 7 with the [illegible] gyro unit turned [illegible] and [illegible] to [illegible]

[illegible]

[illegible]

[illegible]

[illegible]

[illegible] with the [illegible] switch on the control panel in the "Off" position, [illegible] switch on the [illegible] control panel, [illegible] the [illegible] voltmeter, indicated in step 2, to the [illegible] terminal on the control panel and [illegible] voltmeter to the "Out" terminal on the control panel.

9. Set the [illegible] switch on the control panel to the "Off" position. [illegible] the measurements obtained in Table [illegible].

10. With [illegible] switch on the control panel, connect the [illegible] voltmeter, indicated in step 2, to the [illegible] terminal on the control panel and [illegible] voltmeter to the "Out" terminal on the control panel.

After the "Run" [illegible] digits come on that now
[illegible] that is for [illegible] press the
"CONTINUE" button.

[illegible] of the control [illegible] and
[illegible] signal of the [illegible] unit feedback output
signal by [illegible]

[illegible] unit current [illegible]

[illegible]

[illegible]

Before re[illegible] the [illegible]
jet vat oil [illegible]
the "Up" [illegible]

[illegible]

now [illegible]

[illegible] in the "Off" position [illegible]
in the "Off" [illegible]
the Table.

[illegible] it is permitted to keep the VK-53 autopilot in the "ZIP" and [illegible] with a temperature range of the open air for 6 days.

[illegible] for storage or sending in steps in and to [illegible] in ventilation.

[illegible] with the instruments to [illegible] and [illegible] in the warehouse, as in the [illegible] at the [illegible].

The [illegible] must be entered in the log book

[illegible] with [illegible] the [illegible], while [illegible] on [illegible]. Store the equipment in the [illegible] on a [illegible].

[illegible] and [illegible] vacuum [illegible] [illegible] [illegible].

[illegible] the [illegible] by the [illegible] to clamped by means of [illegible] [illegible]. Do not [illegible] [illegible] [illegible] on the floor.

[illegible] of the autopilot set of equipment, units and [illegible] by the [illegible] and comprises the following equipment and parts:

No.	Name	Type	Unit No.	Weight, kg.
1	2	3	4	5
1.	[illegible]	[illegible]	[illegible]	[illegible]
2.	[illegible]	[illegible]	[illegible]	[illegible]
3.	[illegible]	[illegible]	[illegible]	[illegible]
4.	[illegible]	[illegible]	[illegible]	[illegible]

1	2	3	4	5
5.	Pole centrifuge, [illegible]	[illegible]		[illegible]
6.	Base, slide	[illegible]	5	[illegible]
7.	Base, [illegible]	[illegible]	[illegible]	[illegible]
8.	[illegible] tool kit		1	[illegible]
9.	Shipping container for [illegible]			
	[illegible] tool kits			[illegible]
10.	[illegible]			[illegible]
	[illegible]			
11.	[illegible] (including [illegible] and [illegible] unit)			[illegible]
12.	[illegible]			[illegible]
13.	[illegible]		1	[illegible]
14.	Tubing, [illegible]	[illegible]		[illegible]
15.	[illegible]			[illegible]
	[illegible]			

[illegible] set of spare parts, tools and devices, box will be assigned according to drawings 637.00.00.000, 637.01.00.000 and 637.[illegible].00.000.

The set of spare parts, tools and devices is packed and stored in [illegible] way as the [illegible] autopilot.

The [illegible] are:

a) In the [illegible] tion is [illegible] 657.04.00.000 instead of [illegible] for [illegible] the mountings with GA-110 relay connectors are [illegible] with [illegible] polarized relays and [illegible] and [illegible] fuses;

b) [illegible] tool kits are packed in a wooden box (drg. [illegible]).

NOTE: It is permitted to keep the autopilot tool kit [illegible] the general tool kit for the "KS" missile.

When storing periodically check the autopilot units [illegible] in the set of spare parts, tools and devices in the [illegible] of the autopilot and its individual units which were not installed in the "KS" missile and which are stored in the storage.

It is permitted to store the [illegible] autopilot in the [illegible] "D" version covered with a tarpaulin cover [illegible] throughout the entire guaranteed [illegible].

10. [illegible] of AK-3 autopilot in storage

1. When storing the AK-3 autopilot in the "KS" missile (or with the [illegible] unit removed from the missile) preserved in accordance with the present TU-65-[illegible], section III, instructions on preservation and extended storage of the "KS" winged missile, check after every 4 months 10% of the AK-3 autopilots of the batch but not less than 3 autopilots.

[illegible]: The [illegible] [illegible] number of autopilots subjected to [illegible] month.

2. [illegible] storing the [illegible] autopilot in the "[illegible]" missile covered with a [illegible] cover in the [illegible], check all 100% of the autopilots [illegible] less than once a month.

3. [illegible] the [illegible] autopilots, which were not installed in the [illegible] missile, and the autopilot individual units [illegible] in [illegible], check after [illegible] months 10 of the [illegible] or their individual units of the batch but not less than [illegible] autopilots (units).

4. [illegible] as specified in [illegible] the [illegible] autopilots [illegible] not [illegible] during the previous period [illegible].

5. [illegible] autopilots in [illegible] must meet the requirements [illegible] during [illegible] must be within [illegible].

[illegible]: [illegible] is not [illegible] of the [illegible] autopilots in the [illegible].

6. The time, required for a continuous operation of the autopilot energized during all [illegible] specified in [illegible], must not [illegible] following [illegible] of not less than a half an hour.

[illegible], it is permitted to change the succession of [illegible] the autopilot programmed operation and [illegible] during the first [illegible] after the autopilot is switched on.

7. If the [illegible] autopilots, taken for the next check in turn, are defective (corrosion included), check an additional number of the autopilots equal to the initial number of the autopilots to be checked.

If similar or some other defects are found in the autopilots checked, check all the [illegible] of the autopilots included in the batch.

8. If during the check of an additional number of the [illegible] autopilots (checked according to step 6), defects are not found, all the autopilots of the batch checked (defective excluded) can be admitted to a further storage.

The way of delivering the unsatisfactory reports and elimination of defects in the defective units is given in the "Instructions for making up the unsatisfactory reports".

9. During each periodic check enter the results of checks and information on all the operations performed during the inspection and checks in the certificate for the autopilot and the individual units.

10. The [illegible] autopilot operating time, required for the periodic checks during storage, is determined by the time required for the checks specified by these instructions.

11. After the expiration of the AUK-5B autopilot storage life (for all specified storage conditions), check all the

autopilots as specified in these Instructions for the periodic checks during storage.

The decision on the AK-[illegible] autopilot further storage and operation is adopted by the comission appointed by the organization commander.

12. CHECKING THE AK-[illegible] AUTOPILOT OPERATION IN MOTION WITHOUT REMOVING IT FROM THE "KS" MISSILE

1. After depreserving the "KS" missile and attaching the missile wings, remove the [illegible] gyro unit from the missile.

Visually inspect all the autopilot units. Check that the units and cables outer surfaces are free from damage.

If corrosion is found on the autopilot units, proceed as outlined in steps 7-8, par. 20, these instructions.

2. Disconnect plug connectors No.32 and 33 from the missile wiring system and check the [illegible]-4 servo unit as indicated in par. 6 (steps 3-6); when checking the [illegible]-4 rudder servo unit, connect plug connector No.32 to the AK-1 panel, when checking the [illegible]-4 elevator servo unit, connect plug connector No.33 and when checking the [illegible]-4 ailerons servo unit connect plug connector No.35.

NOTE: 1. During this check the [illegible]-4 servo unit outlet shaft direction of rotation indicated in

par. 6 (steps 3-6) corresponds to deflection of the control surface (ailerons) connected to the II-4servo unit to be checked.

3. When checking at a temperature below 0°C,, when storing the "K2" missile in the hangar), the II-4 servo units sensitivity must be:

with the "WINDING SELECTOR SWITCH" in "1", "2" and "3" positions....0.3-1.56 mA

and in "4" position .....0.62-2.82 mA

When checking sensitivity use the UP-1 panel with the M5-2 test instruments at a temperature of -5°C and with the M5-2 test instruments at a temperature of -40°C.

3. Check the II-4 rudder and elevator servo units without disconnecting plug connectors Nos.32 and 34 via plug connector 34 by means of the connecting cable. After checking the II-4 servo units, connect plug connectors Nos.32 and No.33 to the missile wiring system.

[redacted]

4. During the AMK-53 autopilot storage under normal conditions the sensitivity of the M-4 servo units installed on a fixed base should be 0.5-1.2 mA with the "WINDING SELECTOR SWITCH" in "1", "2" and "3" positions and 0.95-2.22 mA - in the "4" position.

3. Disconnect plug connectors Nos40 and 41 of the missile wiring system from the [illegible] inverters and check the inverters operation as outlined in par. 6(steps 8-10).

NOTE: When checking the [illegible] inverters at a temperature below 0°C (when storing the "KC" missile in the hangar) use the [illegible] panel with the [illegible] and [illegible] test instruments only to check rotation of the [illegible] panel gyro motors without measuring the input and output current and the voltage generated by the inverter.

4. Install the [illegible] gyro unit on the [illegible] turn table and connect the gyro unit plug connectors as indicated in par. 8 (steps 3 and 4).

5. Check the autopilot operation as specified in par. 8 (steps 5-10).

NOTES: When checking at a temperature below 0°C (when storing the "KC" missile in the hangar):

a) apply the "UNCAGING" command, 6 min. after power is supplied;

b) the elevator must return to the initial position 40-43 sec. after the " П-18МО START." button is pressed.

6. Check the time required for the yaw and pitch gyro bases to match in the zero position as follows: switch on the "POWER" switch on the П-1 control panel. After the "BASES ZERO" warning lights come on, set the "POWER SELECTOR SWITCH" in the "BOARD CHECK" position and switch on the "CHECK" switch. The "BOARD CHECK" and "CHECK" warning lights must come on.

Fully turn the "RUDDER" knob on the control panel to the "RIGHT". The rudder must smoothly, without jerks, deflect to the right and the right aileron must deflect up. Wait for 7 min. Set the "RUDDER" knob in the zero position and the "CHECK" switch in the "OFF" position. The rudder must move to the neutral position. After 4.5-6.5 min. the ailerons must move to the neutral position and the "BASES ZERO" warning lights must come on.

Switch on the "CHECK" switch and repeat the check with the "RUDDER" knob turned to the "LEFT",

After the "BASES ZERO" warning lights come on switch on the "CHECK" switch and fully turn the "ELEVATOR" knob upward.

The elevator must smoothly, without jerks deflect up. Make an interval for 4 min. Set the "ELEVATOR" knob in the zero position and the "CHECK" switch in the "OFF" position. The elevator must move to the neutral position. After 2-3.5min the "BASES ZERO" warning light must come on.

Switch on the "CHECK" switch and repeat the check with the "ELEVATOR" knob turned to the "DOWN" position.

Check the time required for the bases to match at a supply voltage of 26 V.

7. Check the autopilot transmission ratios as indicated in par. 19, step 6.

NOTES: 1. When checking at a temperature below 0°C (when storing the "KC" missile in the hangar):

a) make an interval for 7.5 min. when sending the "DIRECTION" signal; in this case the "BASES ZERO" warning lights must come on 4-7 min. after the "CHECK" command is removed.

b) when sending the "PITCH" signal, make on interval for 5 min.; in this case the "BASES ZERO" warning lights must come on 1.5-4.0 min. after the "CHECK" command is removed.

c) do not check the autopilot transmission ratios.

2. When storing the "KC" missiles in the hangar, check the time required for the bases to match once in 6 months.

8. Set the "POWER" switch on the П-1 control panel in the "OFF" position. Disconnect the П-2 gyro unit plug connectors and remove the gyro unit from the turn table. Install the П-2 gyro unit in the "KC" missile and check the autopilot operation using the ПНК ground test control panel as outlined in par. 8 (steps 17-24).

9. Enter the results of checks and time required for checking the units and autopilot set energized in the certificates for the individual units and АПК-5В autopilot set.

10. It is permitted to check the [illegible] gyro unit in a reference or any other serviceable autopilot set system as indicated in par. [illegible] (steps 14-25).

In this case we not check the autopilot stored in the set but check the [illegible] servo unit, [illegible] timer and RAT-10A inverter which are stored in the missile as follows:

a) [illegible]-4 servo units - as outlined in par. 6(steps 3-6);

b) [illegible] timers - as outlined in steps 11-13, this par.

c) [illegible] inverters - as outlined in par. 6(steps 8-10).

11. Check the [illegible] timers as follows:

disconnect plug connector No.33 from the missile wiring system. Set the [illegible] switch of the [illegible] panel in the "OFF" position.

Apply power of 26 V d.c. to the control panel. Connect the [illegible] tester plug connector No.33 to the panel via the connecting cable. Set the "PANEL" selector switch in the "[illegible]" position and the "[illegible] SELECTOR SWITCH" in the "3" position.

12. Switch on the "[illegible]" and "[illegible]" switches. The elevators must move to the initial position(2.5°-3° Up from the geometric neutral position).

Switch on the "[illegible] START." switch and simultaneously start the stop-watch. 2-3 sec. after the "[illegible] START." switch is on the elevators must deflect through an angle of 8-9.5° Up from the initial position (12-12.5° Up from the geometric neutral position) and 40-42 sec. after the switch is on the elevators must return to the required initial position.

Start the M-18MO timer twice. When starting the timer for the first time, check the elevator angle of deflection and the program starting time (2-3 sec.), to do this, start the stop-watch when the elevator deflects upward. When starting the timer for the second time, check the time of the program completion (40-42 sec.); to do this, stop the stop-watch when the elevator begins moving to the initial position. The second check is performed 20-30 seconds after the first actuation of the program is over.

NOTE: 1. It is permitted to adjust the M-18MO timer rheostat if the elevator fails to deflect through an angle of 12^{0}-12.5^{0} up from the geometric neutral position.

2. If it is necessary to check the programmed operation for the third and subsequent times, bear in mind, that the M-18MO timer operating duty is intermittent consisting of 6 cycles followed by a complete cooling. A cycle implies one actuation of the program.

3. If two stop-watches are available, check the program at a single switching-on of the M-18MO timer.

12. Set the "POWER" switch on the panel in the "OFF" position. Disconnect the panel from the M-18MO timer plug connector and connect this plug connector to the missile wiring system.

13. CHECKING THE AFC-5B AUTOPILOT OPERATION IN STORAGE WITH SOME UNITS REMOVED FROM THE MISSILE

1. After the "Sea" missile is depreserved and its wings are attached, visually inspect the [illegible] control panel, [illegible] servo units, [illegible] timer and [illegible] inverters which are stored installed in the missile. Open the case with the [illegible] gyro unit as indicated in par. 3. and visually inspect the unit. Check that the units outer surfaces and cables are free from damage.

If corrosion is detected, proceed as outlined in steps 7-8, par. 10.

2. Check the AFC-5B autopilot as indicated in par. 12 without checking the autopilot set by means of the [illegible] ground test control panel.

After checking the [illegible] gyro unit, pack it in a metal case as indicated in par. 1(without packing the [illegible] control panel). Enter the results of checks and time required for checking the units and autopilot set energized in the certificates for the individual units and AFC-5B autopilot set.

14. CHECKING THE AFC-5B AUTOPILOT WHEN STORING IT PACKED IN [illegible]

1. Inspect the packing cases. Check the cases for presence of seals and for freedom from damages. Unpack the autopilot units as indicated in par. 3. Inspect all the units. Check the outer surfaces of the units and cables for freedom from damages.

13. CHECKING THE AVK-5B AUTOPILOT OPERATION IN STORAGE WITH SOME UNITS REMOVED FROM THE MISSILE

1. After the "C" missile is depreserved and its wings are attached, visually inspect the B-1 control panel, B-4 servo units, B-6M timer and PA1-1A inverters which are stored installed in the missile. Open the case with the B-2 gyro unit as indicated in par. 3. and visually inspect the unit. Check that the units outer surfaces and cables are free from damage.

If corrosion is detected, proceed as outlined in steps 7-8, par. 10.

2. Check the AVK-5B autopilot as indicated in par. 12 without checking the autopilot set by means of the EMK ground test control panel.

After checking the B-2 gyro unit, pack it in a metal case as indicated in par. 4(without packing the B-1 control panel). Enter the results of checks and time required for checking the units and autopilot set energized in the certificates for the individual units and AVK-5B autopilot set.

14. CHECKING THE AVK-5B AUTOPILOT AFTER STORING IT PACKED IN "C"

1. Inspect the packing cases. Check the cases for presence of seals and for freedom from damages. Unpack the autopilot units as indicated in par. 3. Inspect all the units. Check the outer surfaces of the units and cables for freedom from damages.

If corrosion is found on the autopilot units, proceed as outlined in steps 7-8, par. 20, these Instructions.

2. Check the II-4 servo units as indicated in par. 6 (steps 3-6); in this case, under normal conditions the sensitivity of the II-4 servo units installed on a fixed base is equal to 0.5-1.2 mA with the "WINDING SELECTOR SWITCH" in "1", "2" and "3" positions and 0.95-2.22 mA in the "4" position.

3. Check the MAI-1MA inverters as indicated in par. 6 (steps 8-10).

4. Check the autopilot set operation as outlined in par. 6 (steps 14-23) and time required for the bases to match as outlined in par. 12 (step 6).

After the check is completed, pack the autopilot units in the metal case as indicated in par. 1 and enter the results of checks and time required for checking the units and autopilot set energized in the certificates for the individual units and set of the AEK-5B autopilot.

15. PROCEDURE OF REPLACING THE AEK-5B AUTOPILOT INDIVIDUAL UNITS AND COMPONENTS

1. If during the AEK-5B autopilot operation and storage defects are found, replace the II-1 , II-2 , II-4, II-18MO units, II2-1, II2-2, II2-3, II2-4, II2-6AM, components, polarized relay and trimming rheostat in the II-2 gyro unit, II2-6K II4-1MO component in the II-4 servo unit and II-4-1MO component polarized relay.

2. Remove and install the units to be replaced in the "K" missile in accordance with the "Maintenance and Operating Instructions for the "K" Winged Missile", Book I.

3. Replace the П4-ТМО component in the П-4 servo unit as follows:

remove the seal and unscrew by socket wrench two studs attaching the defective П4-ТМО component to the П-4 servo unit and remove the component from the unit. Install a new П4-ТМО component on the П-4 servo unit.

Carefully insert two attaching studs of the component into the holes in the component casing and tighten the studs by the socket wrench; tighten the studs alternately, and evenly, secure the studs with a locking wire and seal it with the using organization seal.

4. Replace the РПО polarized relay in the П-2 gyro unit as follows:

Unscrew 6 screws attaching the П-2 gyro unit side cover. Unscrew 4 screws attaching the defective relay to the П2-6М (П2-6АМ) component and remove the relay out of the unit. Carefully install (without touching the electric wires) a new polarized relay in the П2-6М (П2-6МА) component and tighten the relay attaching screws; tighten the screws alternately and evenly. Secure the screws with АК-20 nitro glue according to instructions No. ИВ-82I (See the appendix). Screw the П-2 unit side cover, in this case safety the screws with АК-20 nitroglue according to instructions No. ИВ-82I.

5. Replace the trimming rheostats as follows:

Remove the П-2 gyro unit lower cover.

Unsolder the wires from the trimming rheostat to be replaced and measure the resistance set for the given rheostat.

3. Replace the [illegible] component in the [illegible] servo unit as follows:

remove the seal and unscrew by socket wrench two studs attaching the defective [illegible] component to the [illegible] servo unit and remove the component from the unit. Install a new [illegible] component on the [illegible] servo unit.

Carefully insert the attaching studs of the component into the holes in the component casing and tighten the studs by the socket wrench; tighten the studs alternately, and evenly, secure the studs with a locking wire and seal it with the using organization seal.

4. Replace the [illegible] polarized relay in the [illegible] gyro unit as follows:

Unscrew [illegible] screws attaching the [illegible] gyro unit side cover. Unscrew [illegible] screws attaching the defective relay to the [illegible] component and remove the relay out of the unit. Carefully install (without touching the electric wires) a **new** polarized relay in the [illegible] component and tighten the relay attaching screws; tighten the screws alternately and evenly. Secure the screws with [illegible] nitro glue according to instructions No. [illegible] (see the appendix). Screw the [illegible] unit side cover, in this case safety the screws with [illegible]-20 nitroglue according to instructions No. [illegible].

5. Replace the trimming rheostats as follows:

Remove the [illegible] gyro unit lower cover.

Unsolder the wires from the trimming rheostat to be replaced and measure the resistance set for the given rheostat.

3. Replace the [illegible] component in the [illegible] servo unit as follows:

Remove the seal and unscrew [illegible] socket wrench two studs attaching the unit [illegible] component to the [illegible] servo unit and remove the component from the unit. Install a new [illegible] component in the [illegible] servo unit.

Carefully insert the threading studs of the component into the [illegible] of the servo unit, taking care to tighten the studs by the socket wrench, tighten the studs alternately, one evenly, secure the unit with a locking wire and seal it with the wiring crimping wire seal.

4. Refill the [illegible] volumizer ring in the [illegible] gyro unit as follows:

Unscrew [illegible] securing the [illegible] gyro unit side cover. Unscrew [illegible] at inside the detection relay to the [illegible] (ДК-[illegible]) [illegible] and remove the relay out of the unit. Carefully [illegible] without touching the electric wires) a new alarming relay in the ДК-[illegible] ([illegible]-ДИ) component and tighten the [illegible] attaching screws. tighten the screws alternately [illegible] secure the screws with АК-20 nitro glue according to instructions No. ИИ-[illegible] (see the appendix). Screw the [illegible] side cover, in this case safety the screws with АК-20 nitro glue according to instructions No. ИИ-[illegible].

5. To [illegible] the trimming rheostats as follows:

Remove the [illegible] gyro unit lower cover.

Unsolder the wires from the trimming rheostat to be replaced [illegible] measure the resistance set for the given rheostat.

[redacted]

3. [illegible] component in the [illegible] servo unit as follows:

[illegible] the screws [illegible] socket wrench two studs attaching the [illegible] component to the [illegible] servo unit [illegible] the mounting studs in the unit. Install a new [illegible] with the [illegible] servo unit.

[illegible] the mounting studs of the component into the [illegible] and screw, using the wrench, the studs by the [illegible] the studs alternately, and evenly, [illegible] with the leading wire and seal it with the white sealing wax.

4. [illegible] the [illegible] component in the [illegible] servo unit as follows:

Insert [illegible] ring, the [illegible] servo unit side cover. Insert [illegible] the flexible cable to the [illegible] (Fig. [illegible]) [illegible] make the refit out of the unit. Carefully [illegible] (prior to pulling the flexible wires) a new [illegible] (41) component and tighten [illegible] retaining screws. Tighten the screws alternately [illegible] use the screws with hi-fi nitro fine [illegible] connections to. Refer to the appendix, Note [illegible] cover, in this case safety the screws [illegible] with glue according to instructions No. [illegible].

5. [illegible] as follows:

"Remove [illegible] servo unit lower cover".

Unsolder the wires from the trimming rheostat to be replaced [illegible] the resistance out for the given rheostat.

2. [illegible] component in the [illegible] servo unit as follows:

[illegible] socket wrench two studs [illegible] component to the [illegible] servo unit [illegible] unit. Install a new [illegible] unit.

[illegible] studs of the component [illegible] tighten the studs [illegible] the stud alternately, one [illegible] with a locking wire and seal it with the [illegible].

[illegible] in the [illegible] gyro unit [illegible].

[illegible] gyro unit side cover. [illegible] relay to the [illegible] remove the relay out of the unit. [illegible] (touching the electric wires) a new [illegible] component and [illegible] mounting screws; tighten the screws [illegible] the screws with [illegible] nitro [illegible] (see the appendix) [illegible], in this case safety the screws [illegible] according to instructions [illegible].

[illegible] as follows:

[illegible] with power cord.

One [illegible] from the trimming rheostat to be replaced [illegible] for the given rheostat.

2. (illegible) component in the (illegible) servo unit as follows:

(illegible) socket wrench two studs (illegible) component to the (illegible) servo unit (illegible) unit. Install a new (illegible) servo unit.

(illegible) studding studs of the component into (illegible) and then using an (illegible) tighten the studs by (illegible) alternately, and (illegible) with a locking wire and seal it with the (illegible).

3. (illegible) polymerizing in the (illegible) gyro unit as follows:

(illegible) the (illegible) gyro unit side cover. (illegible) the defective relay to the (illegible) (illegible) and remove the relay out of the unit. (illegible) (without touching the electric wires) a new (illegible) (illegible) component and (illegible) mounting screws; tighten the screws (illegible) and the screws with (illegible) nitro (illegible) connections No. (illegible) (see the appendix). (illegible) cover, in this case safety the screws (illegible) given according to instructions (illegible).

4. (illegible) trimming rheostats as follows:

(illegible) unit lower cover.

(illegible) the trimming rheostat to be replaced (illegible) resistance set for the given rheostat.

2. [illegible] component in the [illegible] servo unit as follows:

[illegible] by socket wrench the studs securing the [illegible] component to the [illegible] servo unit [illegible] unit. Install a new [illegible] unit.

[illegible] studs of the component [illegible] tighten the studs by the [illegible] studs accurately, [illegible] wire and seal it with the [illegible].

[illegible] in the [illegible] gyro unit [illegible].

[illegible] unit side cover. [illegible] relay to the [illegible] relay out of the unit. [illegible] the plastic wires] a new [illegible] component and [illegible] screws. Tighten the screws [illegible] screws with [illegible] wire [illegible] see the appendix, [illegible] cover, in this case safety the [illegible] according to instructions [illegible].

[illegible] suggests as follows:

"[illegible] unit lower cover."

[illegible] the trimming rheostat to be replaced [illegible] out for the given rheostat.

2. [illegible] component in the [illegible] servo unit as follows:

[illegible] studs which [illegible] studs [illegible] component to the [illegible] servo unit [illegible] mount [illegible] the unit. Install a new [illegible] in the [illegible] servo unit.

[illegible] the mounting studs of the component [illegible] and tighten the studs alternately, and [illegible] the studs with a locking wire and seal it with the [illegible] lead.

3. [illegible] relay in the [illegible] gyro unit as follows:

[illegible] the [illegible] gyro unit side cover. [illegible] relay to the [illegible] remove the relay out of the unit. Carefully [illegible] (not touching the electric wires) a new [illegible] relay in the [illegible] component and tighten it by attaching screws. Tighten the screws [illegible] the screws with R-45 nitro [illegible] connections to [illegible] the [illegible] cover, in this case safety the screws [illegible] according to instructions [illegible].

[illegible] the trimming rheostats as follows:

Remove [illegible] gyro unit lower cover.

Unsolder [illegible] from the trimming rheostat to be replaced [illegible] resistance set for the given rheostat.

Unscrew the screws attaching the plate with the trimming rheostats to the [illegible] unit casing. Unscrew the nut attaching the rheostat to be removed and remove the rheostat.

Install a new rheostat in place. Secure the rheostat by a screw with a nut (place a washer under the nut).

Install the rheostat without any cant, the adjusting screws must have a clearance between the screw head and hole in the upper plate.

Set the rheostat resistance equal to that measured before the rheostat is replaced.

Solder the wires to the trimming rheostat. Attach the plate with the trimming rheostats to the [illegible] unit casing using the screws (plate to have washers under the screw heads).

Select the trimming screws and nuts with M-3 [illegible] according to [illegible] No. [illegible].

6. After the [illegible] unit is repaired, proceed as follows:

a) Check the [illegible] according to [illegible] 5-13, par. [illegible] with the [illegible] missile [illegible] removed from the missile, as outlined in [illegible]. After the potentiometer is stored in the [illegible].

b) Check the potentiometer transmission ratio as described below:

Note: [illegible] potentiometer transmission ratio at a [illegible] 5°.

[illegible] the [illegible] autopilot [illegible] a ratio meter to check the [illegible] servo [illegible] metallic [illegible] principle.

If the autopilots are packed in the cases the methods of checking the autopilot transmission ratios are the same; in this case the ammount of the П-4 servo units outlet shafts turn must be:

With the П-2 gyro unit deviated in yaw; direction control surface(rudder) - 2.25-2.75° (instead of 2.1-2.9°)
roll control surface (aileron)4-5° (instead of 3.8-5.3)

With the П-2 gyro unit deviated in pitch;
elevator - 4.5-5.5° (instead of 4.3-5.8)

With the П-2 gyro unit deviated in roll:
roll control surface(aileron) -
- 4.5-5.5° (instead of 4.3-5.8).

3. Check the autopilot transmission ratios at a power supply of 26 V d.c.

Check the rudder transmission ratio and the angle of the П-4 aileron servo unit turn controlled by the coordination signals as follows:

After sending the "RUDDER" command, turn the П-2 gyro unit in yaw through an angle of 5°. The rudder must deflect 2.1-2.9° and ailerons - through an angle of 3.8-5.3°.

Turn the П-2 unit in opposite direction through an angle of 5° in yaw. The rudder and ailerons must deflect respectively through the angles of 2.1-2.9° and 3.8-5.3° to the opposite side.

NOTES: 1. The difference in the ailerons deflection in both directions must not exceed 0.5°.

2. If the rudder deflection does not meet the required value, adjust the П-2 gyro unit rheostat No.3 connected in the yaw free gyro circuit. To do this, remove the lower cover of the П-2 gyro unit and rotate rheostat No.3 screw till the required deflection of the rudder is obtained. It is permitted to adjust the rheostat No.3 within 290±29 ohms. The place of the bridge connection for checking the resistance value is given in Table No.3

3. If the ailerons deflection does not meet the required value, adjust rheostat No.12 connected in the coordination signal circuit. It is permitted to adjust rheostat No.12 within the range of 300±30 ohms.

Check the elevator transmission ratio as follows: after sending the "UNCAGING" command, turn the П-2 gyro unit in pitch through an angle of 5°. The elevator must deflect 4.3-5.8°. Turn the П-2 gyro unit in pitch through an angle of 5° in the opposite direction. The elevator must deflect through an angle of 4.3-5.8° in the opposite side.

NOTE: If the elevator deflection does not meet the required value, adjust rheostat No.5 connected in the pitch free gyro circuit. It is permitted to adjust rheostat No.5 within the range of 115±11.5 ohms.

Check the ailerons transmission ratio as follows:

After sending the "UNCAGING" command, turn the M-2 gyro unit in roll through an angle of 10°. The ailerons must deflect 4.3-5.8°.

Turn the M-2 gyro unit in roll through an angle of 10° in the opposite direction.

The aileron must deflect 4.3-5.8° in the opposite side.

NOTE: If the ailerons deflection does not meet the required value, adjust rheostat No.10 connected in the roll feedback circuit. It is permitted to adjust rheostat No.10 within the range of 100±5 ohms.

Table No.6

Resistor No.	Name of electric circuit	Pins across which measurement is performed.	Resistance ohms
3	Yaw free gyro signal circuit	31/3-42/2	290±29
5	Pitch free gyro signal circuit	31/22-42/4	115±11.5
10	Roll feedback signal circuit	35/11-35/13	100±5
12	Bank coordination signal circuit	35/7-35/8	300±30

NOTES: 1. Check resistance by a d.c. bridge having the degree of precision not less than 2.5.

2. The plug connectors pins are arbitrarily designated: the numerator shows the number of the plug connector and the denominator – the number of the plug connector pin.

3. When checking, connect the plugs to the units mating receptacles. Connect the measuring bridge wires to the pins (sockets) of the plug connected.

4. Pins 31/3-42/3; 31/22-42/4 refer to II-2 gyro unit and are manufactured according to a special order with connector plug No.42. Measure resistors 3,5 of the production units cross their contacts.

7. After replacing the II-4 unit or III-1MO component (or polarized relay in this component) check as outlined in par. 6 (steps 3-6) and check transmission ratio of the corresponding channel of the autopilot as described in step 6, this paragraph).

8. After replacing the II-16MO timer check as indicated in step 8, par. 8 (when storing the II-16MO timer in the missile) or as in step 17, par. 6 (when storing the timer in a packing case).

9. After replacing the II-1 control panel, check as outlined in steps 2-5, par. 8(when storing the panel in the missile) or as in steps 13-14, par. 6(when storing the panel in a packing case).

10. After the П2-6М, П2-6АМ components or РПС polarized relay in the П 2 gyro unit are replaced, check as specified in steps 7-10 and 11, par. 5 (when storing all the autopilot units installed in the [illegible] missile or with the [illegible] gyro unit removed from the missile) or as in steps 16, 17 and 20 par. 6 (when storing the autopilot units in packing cases).

11. After replacing the [illegible] or [illegible] components in the П-3 gyro unit, check as indicated in steps 9, 7-11, par. 5 (when storing all the autopilot units installed in the [illegible] missile or with the [illegible] gyro unit removed from the missile) or as in steps 16, 17-21, par. 6 (when storing the autopilot units in packing cases) and check the transmission ratio of the [illegible] channel as outlined in step 6, this paragraph.

12. After replacing the [illegible] component in the [illegible] gyro unit, check as specified in steps 7, 9, 10 par. 5 (when storing all the autopilot units installed in the [illegible] missile or with the [illegible] unit removed from the missile) or as in steps 14, 18, 22, par. 6 (when storing the autopilot in packing cases) and check the [illegible] transmission ratio as indicated in step 6, this paragraph.

13. After replacing the [illegible] component in the П-2 gyro unit, check as specified in step 8, par. 5 (when storing all the autopilot units installed on the missile or with the П-2 gyro unit removed from the missile) or as in step 15, par. 6 (when storing the autopilot units in packing cases).

14. After replacing swimming rheostats No.3, 9, 10 and 12, check the transmission ratio of the corresponding channel as outlined in step 6, par. 12.

15. [illegible] resistors,
[illegible]
[illegible]
[illegible]

[illegible]

[illegible]

[illegible]

16. [illegible] autopilot
individual [illegible].

[illegible]

1. Perform a separate check of the [illegible] autopilot during the pre-flight preparation as outlined below, bear in mind that:

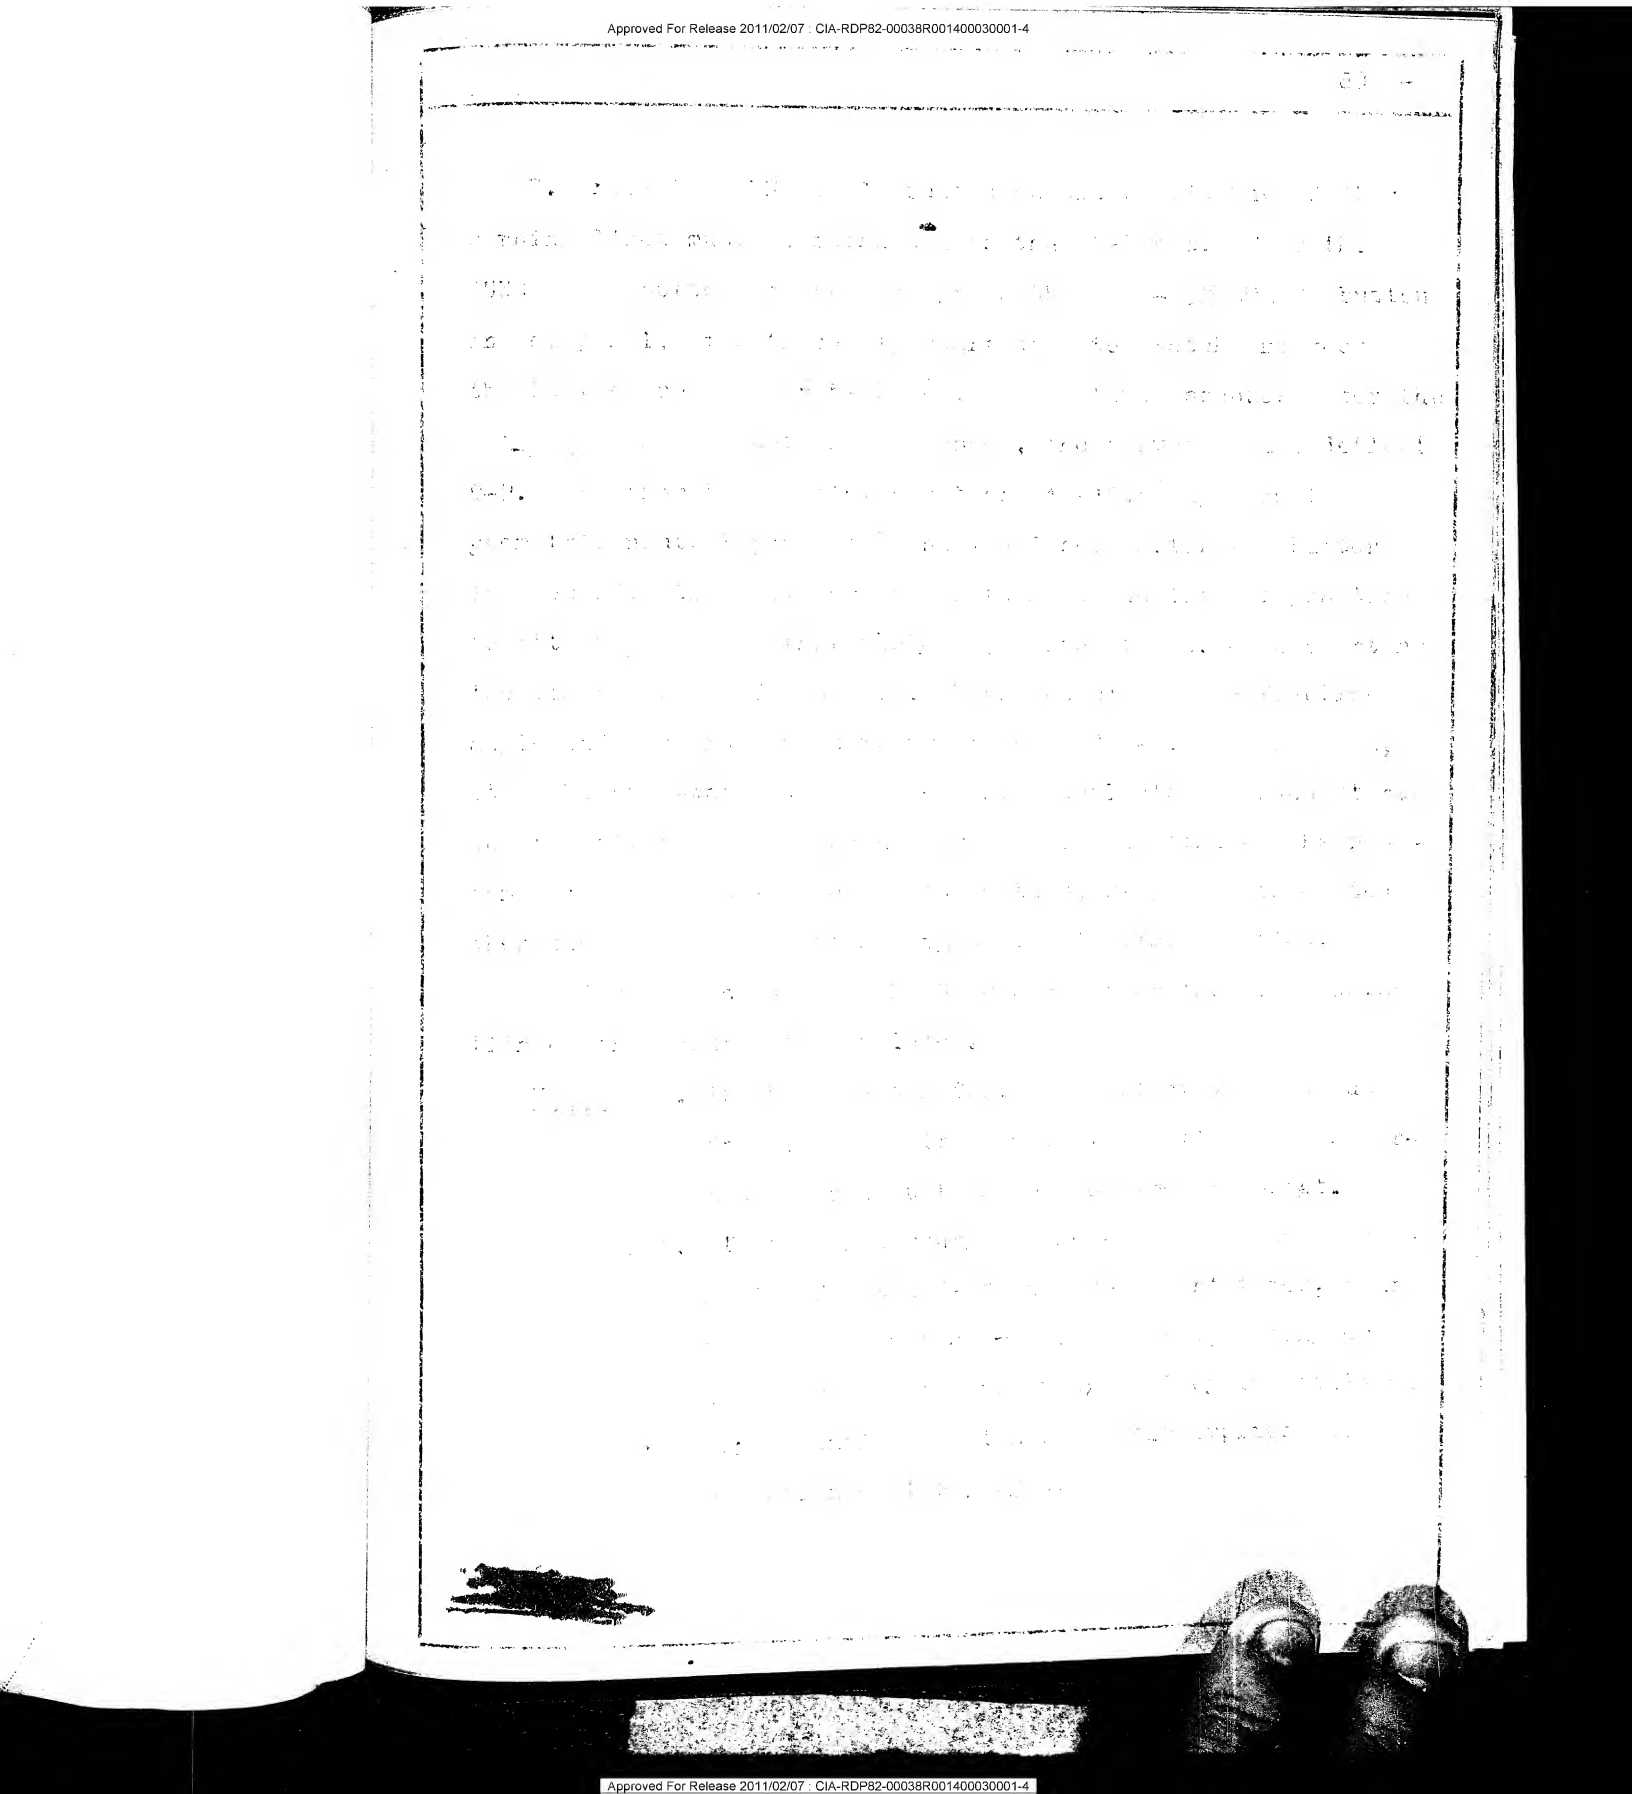
a) the missile stored (installed) the "P2" missile must not be subject to a preliminary check;

b) the amplifier-converters and inboard units are stored being carried from the missile, must be preliminarily checked [illegible] time of the previous period of work, [illegible] par. 1, and after that be [illegible] unit [illegible] missile.

[illegible] working [illegible] must be preliminarily [illegible] the [illegible] of the missile.

2. Bring [illegible] the [illegible] unit on an [illegible] rack.

3. Connect plug connector No.6 [illegible] control [illegible] with the corresponding [illegible] check plug connector No.26 and [illegible] punch through the connecting cable [illegible] spoken plug connector No.12, having disconnected this plug connector from the "A1-15" unit.



3. If two stop-watches are available, check the program at a single switching-on of the [illegible] times.

4. Check as outlined in this step and step 11, [illegible] during the first 30 minutes after the autopilot is on.

5. Upon checking at a temperature below 5°C, the elevator must return to the initial position [illegible] after the "[illegible]" button is released.

6. Install the missile by the wing to the right. The right aileron must [illegible]. Install the missile to the left. The right aileron must deflect up, but the missile in the original position. In this case, the ailerons must be set in the neutral position.

7. Switch on the "[illegible] No.1" switch on the control panel. The "[illegible] No.1" warning light must come on. Turn the "[illegible]" knob to the zero position. The rudder and ailerons must deflect. Set the "[illegible]" knob in the zero position; in this case the rudder and aileron must move to the neutral position. Repeat the check with the "[illegible]" knob turned in the opposite direction.

There is a "[illegible]" knob on the panel. The elevator must deflect. [illegible] knob in the zero position, the elevator must move to the neutral position. Repeat the check with the "[illegible]" knob turned in the opposite direction.

[illegible] time, required for sending a signal of one polarity, must not exceed 15 seconds.

10. Switch on the "[illegible] No.2" switch on the panel. The "COMMAND No.2" warning light must come on. Check how the control surfaces are controlled by the "RUDDER" and "ELEVATOR" pre-set knobs on the panel in the same way as when sending command No.1 in this case when setting the "RUD. T" and "ELEVATOR" knobs in the zero positions. The control surfaces and ailerons must not reflect to the neutral position. Set the "POWER", "COMMAND No.1" and "COMMAND No.2" switches on the panel in the "OFF" position.

11. Using the "[illegible]" switch on the [illegible] control panel cut off [illegible] supply for a short time. The "[illegible]" warning light must come on. The control surfaces and ailerons must occupy the neutral position and the "[illegible]" warning light must become illuminated.

Press the "[illegible]" button on the control panel. The "[illegible]" warning light must go out. After 5 minutes check the free gyros precession. The gyros rigidity must be so that the control surfaces deflection for 5 minutes would not exceed:

rudder ± 1.5°

elevator ± 2.5°

ailerons ± 1.25°.

NOTE: The ailerons deflection also depends on the gyro pre[illegible] precession due to a signal taken off from the [illegible] potentiometer. Therefore, before [illegible] the full free gyro precession, switch on the [illegible] switch on the panel and read the direction [illegible] light. For low value and such a polarity [illegible] the ailerons could move to the neutral [illegible]

order that quickly remove the control signal. In this case the deflection of ailerons from the neutral position will correspond to the roll gyro precession.

12. Set the "G.P." switch on the [illegible] control panel in the "OFF" position. Disconnect the ground test control panel from plug connectors No.36 and 12.

Connect the missile wiring system plug connector No.12 to the "1-12" unit.

Re-energize the missile electrical system.

17. [illegible]

"[illegible]"

1. [illegible] the [illegible] and "1-1" station separate [illegible], source the ground test control panel plug connector "[illegible]", to the autopilot board check plug connector No.36 via [illegible] cable.

[illegible] switches on the ground test supply power of 28 ± 5 [illegible] to the missile electrical system.

3. [illegible] station. The [illegible] warning light on the [illegible] unit must come on. Wait till zero control surfaces are sent from the station to the autopilot check by using the "1-2" panel.

With [illegible] switches on the [illegible] control panel. The [illegible] warning light on the panel must come on. [illegible] the "gyro caging" button.

5. [illegible] from the "1-1" station to engine "[illegible]".

When sending the "RIGHT" signal, the rudder must deflect to the right and the right aileron - up. When removing the signal the rudder and ailerons must move to the neutral position.

When sending the "LEFT" signal, the rudder must deflect to the left and the right aileron - down. When removing the signal the rudder and ailerons must move to the neutral position. When sending the "UP" signal, the elevator must deflect upward. When removing the signal, the elevator must move to the zero position.

When sending the "DOWN" signal, the elevator must deflect down. When removing the signal, the elevator must move to the zero position.

Note: Time required for sending a signal of one polarity must not exceed 15 seconds.

4. Press the "OFF" switch on the U-1 control panel cut off power supply for a short time. The "LOSS" warning light must come on.

Wait, till the control surfaces set in the neutral position and the "READY" warning light becomes illuminated. Set the "CONTROL" switch on the U-1 control panel in the "ON" position.

5. Send command No.1 from the "A" station. The "COMMAND No.2" warning light on the panel must come on. Wait till zero control currents are supplied from the station to the autopilot.

Switch on the "POWER" switch on the U-1 control panel. The "CHARGE" and "READY" warning lights on the panel must come on. After 3 minutes press the "WARNING" button.

Send control signals in regime " [illegible] " from the P-1K station to the autopilot.

The direction of the control surfaces deflection must be the same as in step 3. When removing control signals the control surfaces must not move to the neutral position.

6. De-energize the autopilot as indicated in step 4. Disconnect the ground test control panel from plug connector No.36.

S E C T I O N V

AK-3D AUTOPILOT TEST BEFORE TAKE-OFF

18. TESTING THE AK-3D AUTOPILOT BY USING THE CARRIER-AIRCRAFT EQUIPMENT

1. Connect the ground test control panel plug connector No.38 to the autopilot board check plug connector No.37 through the connecting cable.

Check that the "ON-OFF" switches on the K-3 control panel and "1-13" units are in the "ON" position.

2. Switch on the "AUTOPILOT POWER" and "AP AND K-1" switches on the bombardier control panel in the front cabin. The "AP AND K-1 FAILURE" warning light on the bombardier's panel comes on.

3. Check the autopilot operation using the ground test control panel:

a) switch on the "POWER" switch on the K-3 control panel. The "CAGED" and "GROUND TEST" warning lights on the panel must come on.

b) after 3 minutes, press the "UNCAGING" button on the panel.

The "CAGED" warning light must go out.

Press the "K-3 DEMO TEST" button on the panel and keep it pressed for 5-10 seconds. The elevator must deflect 9-9.5° up from the initial position (12-12.5° up from the geometric neutral position). Wait, till the elevator returns to the initial position.

c) switch on the "[illegible]" switch on the panel, and the control signals by turning the "[illegible]" and "[illegible]" pre-set units knobs. When setting the direction signal the rudder and ailerons must deflect but when setting the pitch signal the elevator and [illegible]. Set the "[illegible]" switch on the panel in the "[illegible]" position.

d) Using the "[illegible]" switch on the [illegible] control panel cut off power supply for a short time. The "[illegible]" warning light must come on. And, all the control surfaces and ailerons are set in the neutral position and the "[illegible]" warning light comes on.

4. Test-run the [illegible] panel signals and check the autopilot operation by the instruments in the front cockpit.

a) Activate the [illegible] panel signals and the "[illegible]" warning light on the [illegible] panel must be illuminated and the roll and pitch [illegible] pointers must be in the middle positions; switch on the "[illegible]" switch on the [illegible] panel in the front cockpit. Turn the [illegible] pre-set unit knob 5° down, the indicator pointer on the [illegible] panel must deflect "down" [illegible] division.

Press the "[illegible]" button, the "[illegible]" warning light on the bombardier control panel must come on and the "[illegible]" missile [illegible] must move 5° [illegible] from the initial position. Record the actual value of the elevator deflection angle.

Set the pre-set unit knob on the [illegible] panel in the zero position.

Switch off the [illegible] seconds switch on the "A" and [illegible] switch on the bombardier's control panel.

The "L.I. UNCAGE" warning light must go out. The "ELEV ZERO" warning light on the [illegible] panel must be illuminated.

Repeat the calibration with the pre-set unit knob turned 3°, 4°, 6° "DOWN", and then "UP" for each value indicated by the pre-set unit; the elevator must respectively deflect "DOWN" or "UP" with a tolerance of ±0.5° for the value indicated by the pre-set unit.

NOTE: When calibrating the angles of 3°, 4°, 6° (unlike 0°) the "ELEV ZERO" warning light must go out.

Calibrate the left suspension in the similar way.

Using the results of measurements make a calibration chart of the elevator deflection angles versus the position of the [illegible] panel pre-set unit knob.

b) Check the elevator deflection angles caused by the [illegible] panel signals as outlined in item 4a, this section with the pre-set unit knob turned 2°, 3°, 4°, 6° "DOWN" and 3° "UP" according to the calibration chart.

In this case the difference between the actual values of the elevator deflection angles and values given in the calibration chart must not exceed 0.5°.

c) In flight the [illegible] panel pre-set unit is set for a required angle by the carrier-aircraft crew in accordance with the "[illegible] pre-set unit operating instructions".

d) Press the "UNCAGING" button on the bombardier's control panel. The "L.I. UNCAGE" warning light must come on.

Press the "[illegible] CAGE" button on the bombardier's panel and keep it pressed for [illegible] seconds. The "PITCH" indicator pointer on the [illegible] panel must sharply deflect. After the

program is completed this pointer must return to the zero position.

e) Switch off and on the "A.P. and K-1" switch on the bombardier's control panel. The "AP UNCAGED" light must go out. The "BASS ZERO" warning light on the AB-1M panel must be illuminated.

5. Set the "OXYGEN POWER" and "A.P. and K-1" switches on the bombardier's control panel in the "OFF" position.

The "A.P. and K-1" "MALFUNCTION" warning lights on the bombardier's control panel and the "BASS ZERO" on the panel must go out.

Set the "POWER" switch on the K-1 control panel in the "OFF" position.

Disconnect the ground test control panel from plug connector No.36.

6. Before a flight, set the "POWER" switch on the K-1 control panel in the "ON" position and then close the access door.

program is completed this [illegible] must return to the zero position.

e) Switch off and pull on the "[illegible] and K-1" switch on the bombardier's control panel. The "[illegible] LOCKED" light must go out. The "DRIFT ZERO" warning light on the [illegible] panel must be illuminated.

5. Set the "[illegible]" [illegible]" and "[illegible] and K-1" switches on the bombardier's control panel in the "OFF" position.

The "[illegible] and K-1" [illegible] warning lights on the bombardier's control panel and the "DRIFT ZERO" on the panel must go out.

Set the "[illegible]" switch on the K-1 control panel in the "OFF" position.

Disconnect the ground test control panel from plug connector No.36.

6. Before a flight, set the "[illegible]" switch on the K-1 control panel in the "[illegible]" position and then close the access door.

S E C T I O N VI

AHK-5B AUTOPILOT PERIODIC MAINTENANCE OPERATIONS

19. AHK-5B AUTOPILOT PERIODIC MAINTENANCE OPERATIONS

PROCEDURES

1. The autopilot maintenance operations are periodic checks of the AHK-5B autopilot units condition which are performed to determine the autopilots serviceability for operation and further storage and also to prepare them so that they would meet the specifications.

2. The periodic maintenance operations are performed by the using organization mechanical personnel of the corresponding speciality.

The record of the periodic maintenance operations is made by the organization engineer or senior technician in the special Log Book or certificates for the autopilot units and set.

NOTE: The form of the periodic maintenance operation log book must correspond to the Aircraft Maintenance Manual.

3. The periodic maintenance operations are scheduled to the period of periodic inspections performed as outlined in paragraph 11, these Instructions.

50. PERIODIC MAINTENANCE OPERATIONS RECORD

Nos.	Operations Performed	Devices, Tools, Materials
1.	Visually inspect all the autopilot units. Make sure that the external surfaces of the units and mountings are free from damages. Remove dust and dirt from the units external surfaces. If corrosion is detected proceed as outlined in step 7, this paragraph. Remove the lower cover of the [illegible] gyro unit and inspect the windings of the trimming rheostats on the unit mounting for condition. If corrosion (green coating) is found on the rheostat winding surface, proceed as specified in step 8, this paragraph.	Portable lamp, mirror, rags.
2.	Disconnect the units plug connectors. Inspect the plug connector pins. If the pins contacting surfaces are dirty, clean them with a bristle brush slightly dampened with [illegible] gasoline and blow with compressed air at a pressure of 1-2 atm. Connect and safety the plug connectors.	[illegible] gasoline, hair brush.

Nos.	Operations Performed	Devices, Tools, Materials
3.	Remove the end cap from the "AB-" rear end housing assembly and take out the brushes from the brush holders. Inspect the commutator surface. If the commutator is burnt, dip a clean rag slightly dampened with "70" gasoline and clean the commutator with "00" sand paper. Measure the inverter brushes length. Brushes worn to 1/2 inch or less must be replaced with new ones. Install all the brushes in the brush holders. Close the inverter rear end housing assembly with the end cap.	Work list 1-70 gasoline. Rags "00" sand paper.
4.	Perform the operations outlined in step 3 on the other "AB-" inverter, incorporated in the autopilot set.	"
5.	Clean the autopilot units and set as specified in: paragraph 12 - when storing the "AB-" autopilot installed in the "Polaris" missile. paragraph 13 - when storing the "AB-" autopilot with units removed from the "SC" missile. paragraph 14 - when storing the "AB-" autopilot in the parking racks.	Test instruments set.

Nos.	Operations Performed	Devices, Tools, materials
3.	Remove the end cap from the [illegible] rear end housing assembly and take out the brushes from the brush holders. Inspect the commutator surface. If the commutator is burnt, clip to wish clean rags slightly dampened with [illegible]-70 gasoline and clean the commutator with [illegible] sand paper. Measure the inverter brushes length. Brushes worn to 14 mm. or less must be replaced with new ones. Install the brushes in the brush holders. Close the inverter rear end housing assembly with the end cap.	Work bit [illegible]-70 gasoline. Rags "00" sand paper.
4.	Perform the operations outlined in step 3 on the other [illegible] inverter, incorporated in the auto-pilot set.	
5.	Check the autopilot units and set as specified in paragraph 12 - when storing the [illegible] auto-pilot installed in the [illegible]. paragraph 13 - when storing the [illegible] autopilot units removed from the "GOF missile". paragraph 14 - when storing the [illegible] autopilot in the packing cases.	Test instruments.

AKA-5b APPARATUS AND EQUIPMENT

21. AKA-5b AUTOPILOT TEST SET EQUIPMENT

1. The AKA-5b autopilot combined checkout in the "A" missile with the A-1 servo unit removed from the missile and also the autopilot checkout on the test stand is performed by means of the test equipment set.

2. Check the AKA-5b autopilot installed in the "A" missile by means of the AKA ground test control panel.

3. The set of the test equipment (dwg.379.00.00.000) incorporates:

AKA-1	control panel	- 1
AKA-2	mounting	- 1
AKA-3	simulator	- 2
AKA-4	junction box	- 3
AKA-5	turn table	- 1
	Connecting cables	- 1 set.

NOTE: When checking the AKA-5b autopilot installed in the missile, the AKA-3 simulators and AKA-4 junction boxes are not used.

The test equipment set is shown in Fig.12.

AKA-1 control panel (dwg.379.00.00.000 or 379.00.00.000) is a rectangular [illegible] 280 [illegible] 2 mm and is made from [illegible].

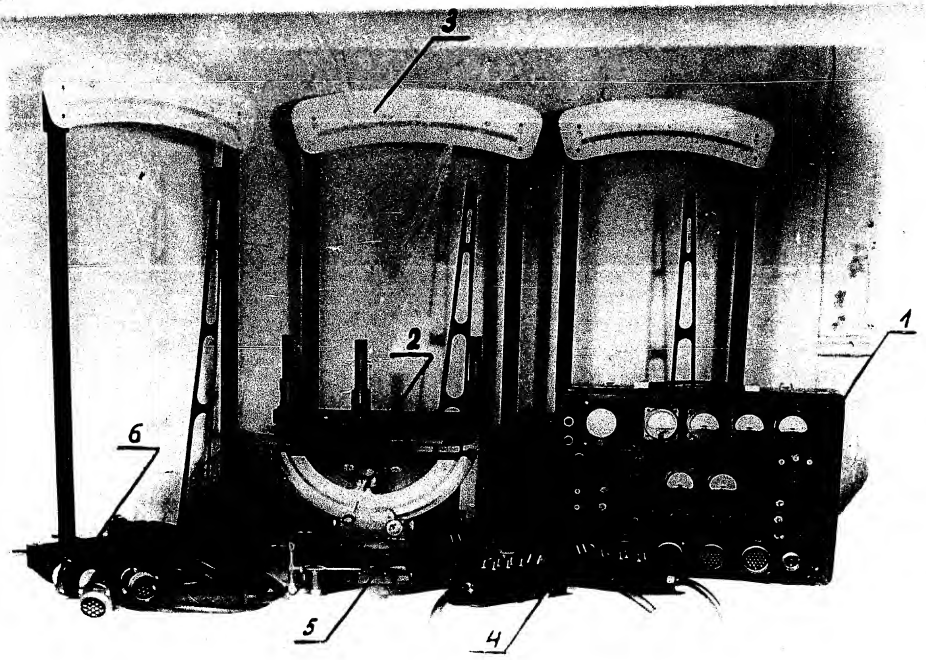

Fig.12. Test Equipment Set.

1. - KIIA-I control panel; 2 - KIIA-2 mounting; 3 - KIIA-3 simulator; 4 - KIIA-4 junction box; 5 - KIIA-5 turn table; 6 - connecting cables.

Approved For Release 2011/02/07 CIA-RDP82-00038R001400030001-4

Shock-mounted to the control panel casing is the face panel carrying all the control panel electrical units and the clock showing the time during which the autopilot is energized. The clock is started by a special electromagnetic relay built-in the control panel which is actuated whenever the autopilot is energized.

The autopilot supplies D.C. power of 26 V to plug connector No.43 to feed the control panel circuits. The panel is provided with a special "POWER SELECTOR SWITCH" used to change the modes of the control panel functioning; with the "POWER SELECTOR SWITCH" in the "BOARD CHECK" position, the autopilot is checked via the board check plug connector, and with the switch in the " ДК-17М SIMULATOR" position, the autopilot check is simulated by means of the ДК-17М panel of the carrier-aircraft and with the switch in the "К-1М SIMULATOR" position a combined operation of the autopilot and K-1M station is sumulated.

The КПА-1 control panel schematic diagram is given in Fig.13.

The control panel operating temperature range:

a) control panel with test instruments model ИМУ and ИМ-70 (dwg.3790100000) - 20°C to +50°C.

b) control panel with test instruments model ИЭ-2 (dwg. 3370000000) - 35°C to +50°C.

NOTE: When operating at a temperature below zero do not use the clock of the panel (dwg.3790100000); when operating the panel (dwg.3370000000) close the "CLOCK HEAT" switch.

KHA-2 mounting (dwg.3790200000) is intended for attaching the I-2 gyro unit to the KHA-5 turn table. The I-2 gyro unit is secured on three steel posts screwed in the mounting base. The mounting attachment holes are displaced from the line of symmetry to shift the C.G. position of the I-2 gyro unit together with the mounting from the turn table axis of rotation when attaching the unit to the turn table.

This shift is made to prevent the turn table plays from affecting the accuracy of the turning angles measurement. The mounting weight is not more than 8.5 kg.

KHA-3 simulators (dwg. 379.03.00.000) are designed to indicate the I-4 servo units outlet shafts turning angles when checking the autopilot on the stand.

The simulator scale is graduated from 0 to $\pm 15^{\circ}$. Each degree division is divided into 10 parts i.e. the scale division value is equal to 6 minutes of arc. The angles are indicated by the pointer attached to the outlet shaft of the I-4 servo unit to be checked. The simulator weight is not more than 7.2 kg.

KHA-4 junction boxes (dwg.379.04.00.000) are connected to the autopilot circuit when checking the autopilot on the stand to permit switching-on and checking of the I-4 servo units various control circuits. The junction box weight does not exceed 1 kg. The junction box schematic diagram is given in Fig.14.

KHA-5 turn table (dwg.379.05.00.000) is designed to set the I-2 gyro unit angle of turn about 3 mutually perpendicular axes. Angles of the table turn (see Fig.15):

The above mentioned [illegible] the turn table are [illegible] in operation by careful handling and periodic maintenance operations performed as follows:

a) once a month thoroughly wipe (without disassembling) the frictional surfaces of the lower and upper semi-cylinders with a clean cloth or rags and then cover them with a light coating of OKB-122-7 lubricant;

b) adjust the angular play by means of eccentric bearings and locking screws.

The turn table weight is not more than 21 kg.

Connecting cables (dwg.379.06.00.000) are intended to connect the autopilot units when checking the autopilot on the stand and to connect the II-2 gyro unit, removed from the missile, to the missile wiring system and KPA-1 control panel when checking the autopilot in the missile.

Incorporated in the test equipment set are 12 connecting cables and KPA-1 control panel power supply cable.

3. The elementary circuit description

The unit "СЛ КО-Р" is a relay device, which gives away the execution command (+27 v) for missile "КО" self-destroying to the aeropilot elevation driver when the Radar A-regime A.G.C. output voltage is less than a preestablished value. The A.G.C. goes through the plug-connection "Ш -20" pin N 5. When missile "КО" guidance is normal beam-riding, the A.G.C. output voltage, applied to the balanced network, cutsoff the unit from

Ф. XVa

[redacted]

the "KC" control devices by means of the [illegible], which is placed in the [illegible] In the other case, when the [illegible] voltage [illegible] the unit initiates the [illegible] [illegible] [illegible].

[illegible]

[illegible] the [illegible] off the self-[illegible] [illegible] voltage momentary disappearances.

The [illegible]-borne power [illegible] through the closed relay P-3 contacts to the intermediate relay P-4, which de-energizes the control relay P-5, and with it disconnects the unit from the control circuit of the

autopilot elevation driver. If the missile "KC" goes out from the target beam, the A.G.C. voltage starts decreasing. When it becomes less than a level necessary to hold the relay contacts in a working position, the +150 v is disconnected from the "memory" circuit by means of [illegible].

The [illegible] starts discharging across the resistor R5, and the relay [illegible] but some time later the relay P2 opens the contacts and switches off the +150 v. The relay P2 remains [illegible] the missile [illegible] will be closed and the missile will [illegible] be operated by the [illegible] of the relay P5, which [illegible] and stops the [illegible] of the plus [illegible] to the [illegible].

The [illegible] R9 and the resistor R10 [illegible] voltage of [illegible] v between the [illegible] 19 and the [illegible] relay P2 remains, amount, when the [illegible] level at the tube 6Zh grating grid is constant.

The relay P2 provides the work of the self-destroying circuit in the case, when the main KL-5BP A.G.C. detector tube 6Zh-7B is defective. When this fact takes place the unit KL-5BP gives away a voltage approximately equal to -45 v + -30 v, the relay opens its contacts K 2 and K 3, +150 v is disconnected from the "memory" circuit and it will produce self-destroying command.

The resistor R6 is matched so, that the relay P2 operates, when the plus [illegible] 20 [illegible] K 5 voltage is equal to 20 v ± 2v.

Ф. XIII

The resistor R5 limits current flowing in the [illegible] driver relay winding. The jack "J-1" provides monitoring of relay K-1 releasing in checking the relay operability.

II. The unit operational instruction

1. General

When the unit "Voltmeter" is used it is necessary to:

a) Set a necessary operating sensitivity of the unit;

b) Establish the zero-line on the face of the device by means of the zero knob;

c) Check the unit calibration, make necessary checking on the external standard voltage source.

2. [illegible]

[illegible]

3. Checking

a) After switching on the unit and the warming-up, if not so, set the "Sensitivity" switch to the position "3 V" and the "Multiplier" switch to the position "1";

b) connect the zero terminal of the unit to the ground bus;

c) switch on the "Sensitivity" switch to the "V" input signal range equal to 45 dBm;

d) turn the unit "Adjustment" potentiometer to the most "sensitivity" clockwise so that it will not mean it will be done, the voltmeter must indicate voltage at the jack "Г-I";

e) turn slowly the potentiometer knob counter-clockwise until the jack "Г-I" voltage disappears;

f) increase the signal power up to -4 dBm; voltage must appear at the jack "Г-I" in this case;

division indicates failure of the contact of the "drop" or "-27 v" network.

e) release the button "KOM. N I";

f) set a signal power equal to -40 dbm; push the button "KOM. N I", wait 5-10 sec., the unit must not produce the dive signal. Release the button "KOM. N I";

g) decrease the input signal down to -45 dbm; push the button "KOM. N I", 5 ± 7 secs later the unit must produce the dive signal.

h) switch off the relay and use autopilot.

Remark: To push "N. PILOT" operating sensitivity [illegible] be set before every flight maneuver [illegible] "K" amplifier.

4. Overall adjustment when in the aerodrome

The unit "KOM" aftersales servicing is to be carried out jointly with the complete system checking on the ground. In the air before laying on flight course by the navigator-bombardier.

The checking should be carried out in the following succession:

a) the unit is to be checked after overall complete system checking;

b) when the Radars L-17M and K-17M are switched on and the Autopilot is catched, the navigator-bombaimer should push the board "DK-17M" button "command N I" and order "Attention! Switch off high voltage!" to the navigator-operator.

c) measure time interval between the Radar X-III transmitter switching off and the moment of the unit "ANC-11" dive signal appearance. When the unit is operating normally, the position of the board "ИК-17И" elevator indicator must deviate to the left at 9 ± 1 division in 6 ± 2 sec after the moment of the Radar X-III transmitter switching off.

d) [illegible] the unit "ANC-11" the indicator [illegible] and the unit "ANC-11" [illegible]

5. [illegible]

1. The unit "ANC-11" are shipped in [illegible] in accordance with the chart "ИС" [illegible]

2) [illegible]

[illegible]: Storage is to be kept in ventilated premises, within +5° ÷ +40°C, relative humidity no more than 80 percent. Storage of the units together with acids, alkalies and poisonous substances is prohibited.

2. All the units must be packed, using board boxes (drawing № БП-4-180-013). Boxes, containing units, should be ~~@~~ protected with a polychlorovinyl cover and stowed in a packing case (drawing № БП-40-00) in fours in each case.

6. Transportation of the units

1. The units are allowed to be transported in the above-mentioned packing.

a) by truck:

- max. distance 500 km at a speed no more than 30 km/hour (natural road) and at a speed of 40 km/hour (highway).

b) by rail, by water and by air:

- any distance.

7. Regulation works

1. Regulation works include:

a) superficial examination,

b) electrical parameter checking.

2. When the units СЛКС-1А are installed in the objects "КС", the regulation works are to be carried out simultaneously with the regulation works of the object "КС".

3. When the units С КС-1А are stored in storehouses the regulation works must be carried out monthly.

8. Manufacturer's guarantee

The manufacturer guarantees 1000 operational cycles during 12 months from the date of arrival in the port of destination.

INVERTER MODEL ПАГ-1ФА DESCRIPTION

INVERTER MODEL ПАГ-1ФА

DESCRIPTION

INVERTER, MODEL ПАГ-1ФА

DESCRIPTION

I. GENERAL

The ПАГ-1ФА inverter is designed for feeding special units with a three-phase 400 c.p.s. A.C. and represents a unit consisting of a D.C. motor with compound field winding and a three-phase A.C. generator excited by a rotor permanent magnet.

The inverter is provided with a special filter (see the diagram) used for supressing the inverter radio-noise, the filter consists of three interlocking and one duct capacitors and a choke.

The inverter is connected to the missile electrical system by means of a five-pin plug connector.

The inverter is provided with a built-in adjusting resistor connected in the electric motor shunt winding circuit for maintaining the generator frequency and voltage constant at different ratings.

II. TECHNICAL DATA

A. FOR THE ELECTRIC MOTOR

1. Terminal voltage ..... 27 ± 10 % V
2. Current drawn ..... not more than 3.5 A
3. No-load current at supply voltage of 27 V ..... not more than 2.2 A

4. Speed of rotation ..... 8000±10% r.p.m.

5. Duty ..... continuous

6. R.H. direction of rotation

(as viewed from the commutator end)

B. FOR THE GENERATOR:

7. Voltage ..... 36 ± 4 V

8. Output current ..... not more than 0.51 A

9. Power factor 0.65

10. Frequency ..... 400 ± 10% c.p.s.

C. MTO-7 BRUSHES ("7" – a specific Mfr's Mark)

11. Size ..... 6.5x7x14 mm.

12. Quantity 2

13. Tension on brushes ..... 225±25 gr

D. MAGNETO-TYPE BALLBEARINGS No. 6007...ГОСТ 2

E. Weight ..... not more than 3.5 kg.

III. INVERTER ELECTRICAL SYSTEM

The inverter wiring schematic diagram is given in Fig.1.

IV. D E S I G N

The inverter is provided with a fan-assisted cooling (Fig.2).

The iron laminations of the electric motor and generator stators are mounted in a common casing (1), cast integral with a support.

The electric motor armature and generator rotor are mounted on a common shaft (2). The electric motor magnet system

s two-pole. The electric motor field coils windings (3) are connected in series.

The end of the series field winding is connected to the positive brush-holder.

The end of the shunt field winding is connected to the regulated adjusting resistor (12) located in the support.

The negative brush-holder wire is directly connected to the plug connector, and the common field winding end-to the plug connector (Fig.1) via the duct capacitor and the choke mounted on the end housing assembly (4).

The generator stator winding ends and electric motor filter wires are connected to the plug connector (6) through the holes in the end housing assembly.

The inverter plug connector pins designation corresponds to those in the schematic diagram (Fig.1).

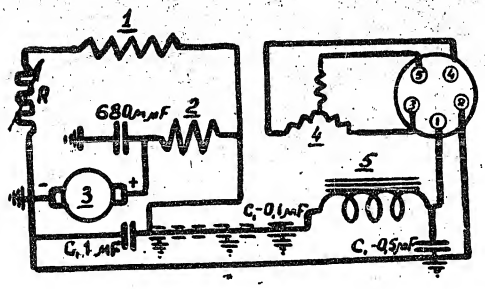
The adjusting resistor (12) mounted in the support is designed for adjusting the A.C. frequency with the inverter operating at a nominal load.

The position of the adjusting resistor slider in the electric motor shunt winding circuit is set at the Mfr's plant and is unchangeable during operation.

Mounted in the support beside the resistor, is the capacitor (11) connected in the filter circuit. The generator rotor is a permanent magnet made in the form of a six-pointed star.

Brushes are inserted in brass brush-holders mounted on the brush-holders bracket (7) which can be turned for adjustment purpose.

Two openings in the end housing assembly (5) covered with



1 Shunt.
2 Series.
3 Armature.
4 Generator.
5 Choke

Fig.1. Inverter Wiring Schematic Diagram

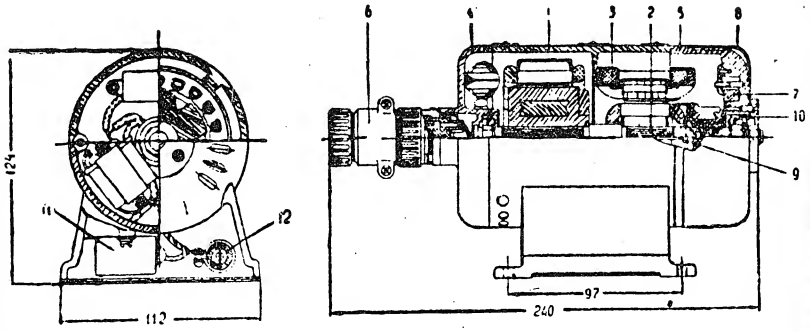


Fig.2. Inverter Cross-Section View

1 - Casing; 2 - shaft; 3 - field coil; 4 - end housing assembly; 5 - end housing assembly; 6 - plug connector; 7 - brush-holders bracket; 8 - end cap; 9 - stud; 10 - ball-bearing; 11 - capacitor; 12 - resistor.

the end cap (8) permit to inspect brushes with the end cap removed.

The end housing assemblies made of aluminium alloy are attached to the casing by two studs (9).

The armature is mounted on the magneto-type ball-bearings (10) which facilitate the inverter assembly and disassembly. The armature end play is compensated by four cylindrical springs producing an axial pressure on the ball-bearing outer race, from the commutator end.

V. INVERTER DISASSEMBLY AND RE-ASSEMBLY PROCEDURE

After the guaranteed service life has expired, disassemble the inverter when a trouble detected can't be remedied without disassembling the inverter and when it is necessary to replenish the ball-bearings lubricant.

If the generator rotor magnet was removed from the stator assembly it must be magnetized and stabilized at the Mfr's plant. The armature should not be removed from the inverter if unnecessary.

Disassemble the inverter as follows:

a) Remove the end cap from the end housing assembly;

b) Disconnect the brushes and pull them out of the brush-holders;

c) Disconnect the field winding end from the brush-holder and disconnect the wire leading from the brush-holder to the plug connector;

d) Release the studs;

e) Disconnect the plug connector from the end housing assembly and unsolder the wires from the receptacle pins;

f) Remove the end housing assembly (5) from the casing; move the end housing assembly (4) 20-30 mm.away from the casing, unsolder the wires from the capacitors and choke, and remove the end housing assembly;

g) Pull the armature out of the casing from the generator end.

When pulling the armature out of the casing, tightly enclose the rotor in a steel tube to prevent the permanent magnet demagnetizing.

Re-assemble the inverter reversing the disassembly procedure. In this case do the following:

a) Before re-assembling the inverter, wash the ball-bearings with clean gasoline. Pack the bearings with a limitted quantity of ЦИАТИМ-201 lubricant; apply the lubricant only to one side of the ball-bearing so that the lubricant would be flush with the bearing ball;

b) Insert the brushes into the brush-holders only after the inverter re-assembly is completed to prevent them from being damaged by the commutator butt.

Pay particular attention to proper fitness of the brushes to the commutator surface. Otherwise, fit the brushes to the commutator by using sandpaper 220 (ГОСТ 3647-47).

If the commutator is burnt, wipe it with a clean cloth slightly dampened with gasoline. Clean the commutator with sandpaper 220 (ГОСТ 3647-47).

c) Lock all attachment parts in the same way as they were locked before disassembly.

After the inverter reassembly is completed, check the armature for free rotation turning it by hand.

When rotating, the armature must not contact the poles and the commutator-the brush-holders.

Stiff or unsmooth rotation of the armature may result from misalignments due to a poor re-assembly.

The inverter insulation is tested:

a) on the motor side - by applying 330 volts D.C. for 10 sec. in this case the electrical circuit must be disconnected from the casing by raising the negative brush and [illegible]-85-II resistor clamp;

Apply the test voltage as follows:

one pole - to the inverter casing, the other - to the plug connector contact "1";

b) On the generator end - by applying 500 volts A.C. for 1 min.

Connect the terminals of the power supply source as follows:

one - to the casing, the other - to one of the plug connector contacts "3", "4", "5".

Check the insulation resistance by using a corresponding megohmeter, connecting its terminals in the same way as they were connected when the insulation was tested.

In both cases the insulation resistance must be not less than 5 megohms.

VI. INVERTER INSTALLATION AND OPERATION INSTRUCTIONS

1. The inverter is installed in horizontal position, and attached by screws inserted through the support holes.

2. The inverter is designed for direct connection to the missile electrical system without any starting relays.

3. After the inverter is connected to the missile electrical system, fully tighten the plug connector coupling nut.

4. During the inverter service, periodically check its brushes and commutator for condition.

At normal operation the operating surface of the commutator is brown and not burnt.

If the commutator is burnt, clean the commutator as outlined in Section V.

Brushes worn by 10 mm. low or less must be replaced with the new ones of the same type.

The a.c. wires must be twisted inside the inverter and shielding conduits.

5. The inverter operates at:

a) Altitude above sea level.....up to 15000 m.

b) Ambient air temperature from -60°C to $+50^{\circ}$C.

c) Relative humidity ..... up to 98%.

Inspector

SUPPLEMENT TO INSTRUCTION No.369-ИЭ

I N S T R U C T I O N S

FOR CHECKING REFERENCE INSTRUMENTS ON PANELS OF 369 ITEM TEST EQUIPMENT

I. INTRODUCTION

This instruction is to be adhered to, when checking the reference instruments on the UA-369 test equipment panels during their service and storage within the guaranteed service life. The checks are performed together with the periodic maintenance operations in accordance with this instruction.

II. GENERAL

The tests are to be carried out under the following conditions:

a) at an ambient air temperature of $+20^{0}\pm5^{0}$C;

b) at an air pressure equal to the atmospheric pressure in the place of the test;

c) at a relative air humidity of 30 to 80 per cent;

d) the reference instruments should have valid certificates which certify their serviceability.

III. PERIODIC MAINTENANCE OPERATIONS IN SERVICE AND STORAGE

The periodic maintenance operations consist in checking the test panels and are performed to determine their serviceability or possibility of their further storage and also to bring them into conformity with the specifications, if necessary.

The periodic maintenance operations are performed by the technicians of the using organization or the Mfr's plant. Entries about the periodic maintenance operations performed are made in a special book by the engineer or chief technician of the organization.

The periodic maintenance operations are performed in the following manner and sequence.

After every 2 months:

1. Inspect all the plug connectors of the connecting cables for damage and corrosion, and remove dust and dirt from them. If corrosion signs are found on the pins, wash the pins with a brush dampened in alcohol and wipe with a cloth.

2. Remove the covers from the [redacted] test panels, inspect the outer surfaces of the panels, instrument panels and plug connectors for damage, panels for proper attachment and shock mounting.

Wipe the outer surfaces with a cloth to remove dust and moisture.

If the plug connector contacts are dirty or affected by corrosion, wash and wipe them clean as described in para.1 of this instruction.

3. Check the knobs for attachment and tighten those loose.

4. If in operation of the [redacted] test panel an unsmooth movement of the "Signal" milliammeter pointer occur due to a

dirty potentiometer, remove the panel and wipe the potentiometer with a chamois cloth slightly dampened in rectified alcohol.

NOTE: a) Carry out the above described operations immediately after a defect is detected during the panel operation irrespective of the time the periodic maintenance operations are to be performed.

b) When installing the panel on shock mounts, seal the panel with sealing compound by filling the sealing cup with the compound and place the cup under the panel attachment screw.

5. Check the panel electric instruments for accurate readings, taking into consideration that the test equipment for the 360 item is manufactured in the following two versions:

1) with reference instruments ensuring operation of the test equipment panels within the temperature range of -35° to $+50^{\circ}$C(M5-2, 3-42I, M1-46).

2) with reference instruments ensuring operation of the test panels within the temperature range of -20° to $+50^{\circ}$C (M4-70, M4C, M4M-70, M1-46).

Given below are permissible errors of the reference instruments for both versions of the test equipment. Therefore, when checking an instrument, refer to the tolerances for the type of the instrument whose error is to be checked.

Checking the Reference Instruments of KIA-I Test Panel

1. Check the operation of the control surfaces position indicators on the KIA-I test panel as follows:

a) supply 26 V D.C. to the 43/12(-)-43/13(+) pins;

b) set the "PANEL POWER SUPPLY" switch to the "BOARD CHECK";

c) supply 26 V.D.C. via a 20 kohms resistor to the 15-14, 16-17, 18-19 pins of plug connector No.43 in turn with the polarity indicated in table No.1.

In this case the indicator pointers should move to the right.

Table No.1.

Supplied voltage polarity		Indicator	Direction of indicator pointer deflection
+	-		
15	14	"Direction"	to the right
16	17	"Pitch"	to the right
18	19	"Bank"	to the right

Change the polarity of the supplied voltage; in this case the indicator pointers should move to the left.

2. Check the reading error of the panel power supply voltmeter by connecting to the 43/12-43/13 pins a d.c. reference voltmeter (0.5 degree of precision with the scale graduated from 0 to 30 V).

Difference in the readings of the two voltmeters should not exceed:

0.9 V - for the M5-2 voltmeter,

0.6 V - for the [illegible] voltmeter.

3. Check the control signal indicators for reading errors.

For this purpose connect a d.c. reference milliammeter (0.5 degree of precision with a 1-0-1 mA scale to the 43/1-43/2 pins. Perform the check with the "PANEL POWER SUPPLY" switch in the "BOARD CHECK" position and the K_1 and K_2 buttons pressed. Turning the knobs of the signal preset units to both sides, compare the readings of the reference milliammeter and the control signal indicators at the scale points 0; 0.2; 0.4; 0.6; 0.8; 1. Difference in their readings, should not exceed:

0.04 mA for the [illegible] milliammeter,

0.06 mA for the M5-2 milliammeter.

Checking the Reference Instruments of [illegible] Test Panel

Test the control surface position indicators for proper functioning.

Supply 26 volts via a 20 kohms resistor in turn to the 14-15, 16-17, 18-19 pins of plug connector No.36 with the polarity indicated in table No.2, In this case the indicator pointers should move to the right.

Table No.2

Indicator	Polarity of voltage supplied to pins of plug connector No.36		Direction of indicator pointer deflection
	+	-	
"Direction"	15	14	to the right
"Pitch"	16	17	to the right
"Bank"	18	19	to the right

change the supplied voltage polarity; this done, the indicator pointers should move to the left.

Checking the Reference Instruments of MI-I Test Panel

1. To check the supply voltmeter reading error, proceed as follows:

a) Supply +26 volts to the "+" terminal, and -26 volts to the "-" terminal of the panel;

b) connect a reference voltmeter (0.5 degree of precision) and ammeter (0.5 deg. of precision) to the 1-2 sockets of the plug connector according to the following diagram:

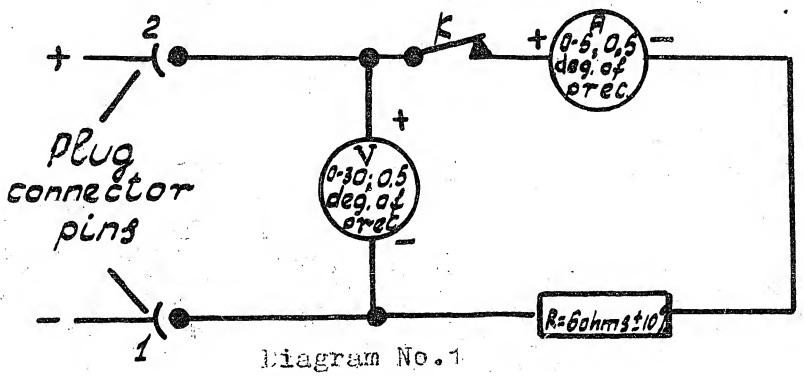

Diagram No.1

c) switch on the "PANEL POWER SUPPLY" switch; in this case the pointers of all the voltmeters and ammeters should move to the right, and the difference in their readings should not exceed:

0.9 V for the M5-2 voltmeters
0.6 V for the MM-70 voltmeters
0.28 A for the M5-2 ammeters
0.18A for the MM-70 ammeters.

NOTE: To take the voltmeter readings, open the ammeter circuit by the switch K.

2. To check the "SIGNAL" milliammeter reading errors proceed as follows:

a) to the 3-4 plug connector sockets connect in series the reference milliammeter of 0.5 degree of precision with a 0-3 scale and the resistor of 100 ohms ±10%;

b) set the "SIGNAL" switch to the II-4 position;

c) set the "POWER SUPPLY" switch to the "ON" position;

d) set the "WINDING" selector switch to the "1" position, and the "SIGNAL" switch to the "1mA" position. Turn the "SIGNAL" preset unit knob on the panel clockwise, and compare the readings (on the points, marked with figures) of the panel milliammeter with those of the reference milliammeter. Difference in their readings should not exceed 0.07 mA.

e) change the polarity of the reference milliammeter connected and make a similar check, with the "SIGNAL" preset unit knob turned counterclockwise;

f) make a similar check, with the "Signal" switch in the "1.5 mA" and "2.5 mA" positions.

With the switch in those positions, the readings of the "Signal" milliammeter and the reference milliammeter should not differ in more than 0.09 mA and 0.14 mA respectively.

NOTE: For the EM-1 test panel whose "SIGNAL"milliammeter of EM-70 type has a "3-0-3" mA scale,the check is performed in a similar manner;difference between the readings of the milliammeters in this case must not exceed 0.11 mA.

Checking the Reference Instruments of IIL-5 Test Panel

1. Check the power supply circuit voltmeter readings for error:

a) supply +26 volts to the "+26 V" terminal, and -26 volts to the "-26 V" terminal of the panel;

b) connect a reference voltmeter (0.5 degree of precision, 0-30 V scale) and an ammeter (0.5 degree of precision, 0-5A scale) to the 1-2 sockets of the cable plug connector according to the following diagram:

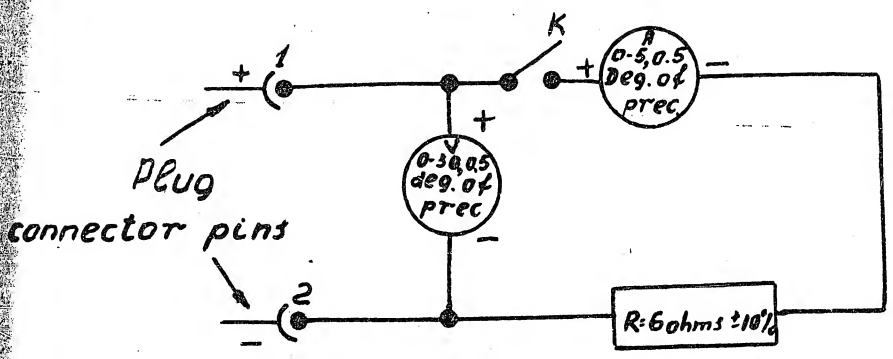

Diagram No.1a

NOTE: If an astatic voltmeter (0.5 degree of precision) is used, disconnect the latter, when checking the ammeter.

c) switch on the "PANEL POWER SUPPLY" switch, this done, the voltmeter pointers should move to the right and difference between their readings should not exceed:

0.9 V for M5-2 voltmeters,

0.6 V for M4-70 voltmeters,

d) close the ammeter circuit by the "K" switch; in this case the ammeter pointers should move to the right and difference between the readings of both ammeters should not exceed:

0.1 A for M5-2 ammeters,

0.1 A for M4-0 ammeters.

3. Check the a.c. voltmeter and ammeter for reading error proceeding as follows:

a) set the phase selector switch to the "1" position;

b) connect a reference ammeter (0.5 degree of precision, 0-1A scale) and a reference voltmeter (0.5 degree of precision, 0-60 V scale) to the 4-4 sockets of the panel plug connector and supply voltage according to the following diagram:

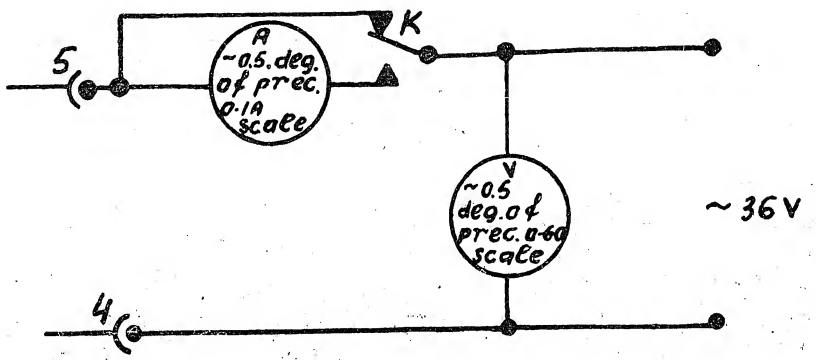

Diagram No.2.

c) switch on the "LOAD" switch on the panel: the p nel ammeter and voltmeter pointers should move to the right.

In this case difference in the readings of the electric instruments should not exceed.

1.0 V for a M-10 voltmeter,

0.03 ma for a M-42 ammeter,

0.03 ma for a M-70 ammeter.

When taking the voltmeter readings, open the ammeter circuit by the "K" switch.
